Acknowledgements

The development of the Gambia livestock master plan (LMP) was undertaken by a joint team of livestock and planning experts from the Department of Livestock Services and the International Livestock Research Institute (ILRI). The analytical work was carried out under the guidance of Mr Mamud, Project Director of the Small Ruminant Production Enhancement Project (SRPEP), and Dr Abdou Ceesay, Director General of the Department of Livestock Services. The work was funded by SRPEP under the Islamic Development Bank loan for the Gambia Livestock Master Plan Project 2020–2022, implemented by ILRI.

A Technical Advisory Committee chaired by the SRPEP project director reviewed and made recommendations related to ensuring progress in achieving the outputs of the LMP project. It comprised experts from key livestock departments and other relevant government and academic agencies of the Gambia. Once completed, all the deliverables of the Gambia LMP were reviewed by eminent livestock experts within and outside ILRI and experts within the Gambia Ministry of Agriculture. They were found credible and defensible.

Many capable individuals and supportive institutions and agencies contributed to the genesis and realization of the Gambia LMP. Without the hard work and goodwill of all of them, the LMP would not have been completed.

We had great luck finding very competent and hardworking professionals to be members of the Technical Advisory Committee. The following are members of the team who contributed immensely to the data collection and validation of parameters and findings:

Experts	Expertise
Dr Sulayman Sonko	Livestock Production and Health
Mr Joseph Faye	Cattle Breeder
Dr Pa Ousman Ceesay	Livestock Production and Health
Mr Jerreh Ceesay	Dairy Farmer
Dr Duto Sainey Fofana	Livestock Production and Health
Mr Ebou Jobe	Livestock Production
Dr Famara Sanyang	Livestock Production and Health
Ms Isatou Savage	Livestock Production
Mr Ebrima Jallow	Sheep Breeder/Farmer
Mr Nerry Corr	Small Ruminant Production and Health
Mr Basirou Jatta	Poultry Expert
Mr Ousman Sanyang	Poultry Expert
Mr Momodou Mass Jobe	Poultry Expert/Farmer
Mrs Tida Ceesay Bojang	Poultry Farmer
SRPEP staff members	Project Experts

The team would also like to thank Dr Duto Sainey Fofana, Mr Omar Njie and Dr Ousman Ceesay for critically reviewing the documents.

We would also like to express our gratitude to SRPEP, RC Engineering and Francis Jones Associates (Joint Venture), particularly Mr Mamud Njie, project director; Mr Nerry Corr, livestock value chain specialist; Mr Amet Sallah, monitoring and evaluation expert; and Mr Sait Touray, project accountant for their efficient project management and insights on the Gambia LMP.

The team's warm appreciation and sincere thanks also go to Mr Hassan Jallow, permanent secretary of the Ministry of Agriculture; and members of ILRI management Dr Isabelle Baltenweck, program leader of Policies, Institutions and Livelihoods, and Dr Iain Wright, deputy director general for Research and Development – Integrated Sciences. The team gained immensely from the constant and exemplary support and expertise of the following colleagues: Dr Nils Teufel, senior agricultural economist, ILRI; Francis Wanyoike, research officer – value chain expert, ILRI; Dr Derek Chan, value chain expert, ILRI; Dr Joshua Aboah, value chain expert, ILRI; Charles Mensah, research officer – livestock policy expert, ILRI; Dr Joseph Karugia, policy and foresight analysis team leader, ILRI; and Prof Charles Frederick Nicholson from the University of Wisconsin - external reviewer, Judy Kimani, communication officer, ILRI; Meron Mulatu, communication officer, ILRI; and Paul Karaimu, publishing manager, ILRI.

In addition, contributions by the following persons offered valuable technical insights, information and good counsel: Kidus Nigussie, herd modeller, ILRI consultant; Dr Badara Loum, consultant and local project coordinator; Mrs Fatou Ndeye Gaye, consultant and gender expert; and Ali Galol, monitoring and evaluation consultant.

On behalf of the SRPEP and ILRI teams, we sincerely thank all these dear friends and colleagues for their invaluable contributions to the success of this significant work. The team hopes the resulting Gambia LMP deliverables will prove helpful to the Gambia in its efforts to attract private sector investments and help small-scale livestock farmer groups, semi-commercial and commercial farmer groups, and other stakeholders benefit more from the livestock sector.

Sirak Bahta, PhD
Senior Agricultural Economist
Project Leader, The Gambia Livestock Master Plan
ILRI

Foreword

The Gambia is a country in the far west of Africa surrounded by Senegal in all directions except the west, which is bordered by the Atlantic Ocean. The country is considered the smallest in mainland Africa with a land size of 10,689 square kilometres. The country's population is around two and a half million, with a gross domestic product (GDP) of USD 2.08 billion, or USD 835.6 per capita.

The economy of the country relies on agricultural activities (fishing as well as crop and livestock farming) besides the service and industry sectors. The agricultural sector is significantly vulnerable to a tropical and Sahelian climate that is characterized by a dry season from November to April/May and the rainy season from May/June to October, with heavy rains experienced between June and October. In the last decade, the contribution of the agricultural sector to the country's GDP has declined significantly; the sector contributed to nearly 20% of the Gambian GDP in 2020 compared to more than one-third (35.2%) in 2010.

According to the Second Gambian National Agricultural Investment Plan, more than half a million smallholder households are engaged in agriculture and natural resources production, and more than two-thirds of the rural labour force derive their livelihoods and income from agriculture-related activities. In this respect, Gambian women remain the majority who are employed in the agricultural sector compared to their men counterparts. Therefore, the sector remains crucial for enhancing food security and nutrition as well as poverty alleviation in the country and for vulnerable households in particular.

The livestock sector contributes 40% of the agricultural GDP and employs the largest number of people in the agricultural sector after the crop subsector. Cattle, small ruminants (sheep and goats), equines (donkeys and horses) and pigs are among the livestock species kept by the Gambian livestock producers. Poultry production and beekeeping are also widely practised.

Overall, the livestock sector in the Gambia is constrained by widespread animal diseases; shortage of animal feed, particularly during the dry season; poor production capabilities of local livestock due to low genetic performance of the indigenous breeds (which include N'Dama cattle, Djallonke sheep and West African Dwarf goats); poor infrastructure; low access to extension, breeding (including artificial insemination) and veterinary services; poor livestock research and innovation capacities; lack of access to affordable and reliable financing schemes; and weak capacity of the relevant sector institutions.

This livestock master plan will help the Government of the Gambia modernize the livestock sector so that it achieves the aims and objectives of livestock farmers and makes sustainable contributions to the government's development objectives as enshrined in its National Development Plan.

Finally, I would like to thank the International Livestock Research Institute (ILRI) for their expertise and professionalism in developing this very important master plan for the Gambia.

A handwritten signature in black ink, appearing to read 'Demba Sabally'.

Dr Demba Sabally
Minister of Agriculture
The Gambia

Foreword

In the Gambia, the livestock sector contributes 40% of the agricultural GDP and employs the largest number of people in the agricultural sector after the crop subsector.

Overall, livestock farming is the backbone of rural communities' food security and nutrition and acts as a source of income, employment, livelihoods and asset saving for the involved smallholder producers and households.

The Gambia livestock master plan will guide the government's objectives for the livestock sector – to reduce poverty, increase economic growth and improve food and nutrition security – as enshrined in the National Development Plan.

I wish to thank the Islamic Development Bank and ILRI for supporting and developing the Gambia livestock master plan.

Mamud Njie
Project Director
Small Ruminant Production Enhancement Project (SRPEP)

Foreword

Agriculture is a vital sector of the Gambian economy, with an estimated 70% of the country's labour force depending on the sector for their livelihoods. The livestock sector in the Gambia contributes about 40% of the agricultural GDP and 3% of the overall GDP. In 2019, the agricultural sector contributed about 22% to the country's GDP, and about 32% of the labour force was involved in active primary agricultural production, according to the Gambia's national statistics.

The performance of the agricultural and livestock sectors plays a key role in poverty reduction and enhanced food security in the Gambia. The livestock sector in particular plays an important role in creating livelihood opportunities and income generation for immediate use and savings among rural inhabitants. Despite the importance of the livestock sector, it is faced with some challenges such as lack of access to feed, fodder and water; disease outbreaks; limited veterinary services; a low level of market linkages; and lack of improved germplasm, all of which hinder the desired sector progress.

To prioritize and target support for the livestock sector as an essential element of agriculture, the Government of the Gambia, through the Islamic Development Bank, requested ILRI to provide technical assistance in developing a comprehensive livestock master plan (LMP). The LMP includes a thorough and systematic analysis of the Gambia's livestock sector, a livestock sector strategy and value chain-specific investment roadmaps. The investment roadmaps constitute a detailed five-year livestock sector investment plan meant to help increase and better target public and private investments. The LMP enables more substantial and better-targeted livestock sector investments from finance ministries, development partners and private sector investors.

The Gambia LMP focuses on three key livestock value chains – cattle, small ruminants and poultry – and then highlights the major interventions which could help achieve the country's future objectives and targets. Some of the key interventions proposed include more engagement of the private sector to spur increased investment in the feed and animal health industries as well as in addressing the existing market gaps. I believe that the proposals provided in the LMP will inform decisions made on investments for the livestock sector to improve its performance, increase farmers' sources of income, and subsequently lead to improved livelihoods through livestock.

ILRI has for the past decade been helping nations develop roadmaps for their livestock sectors upon request, in collaboration with the Food and Agriculture Organization of the United Nations (FAO) and the French Agricultural Research Centre for International Development (CIRAD). We wish to thank the Government of the Gambia and the Islamic Development Bank for entrusting us with this task, and we wish to express our gratitude to our partners who have collaborated with us towards the completion of this policy document.

Shirley Tarawali
Director General (a.i.)
ILRI

1 Executive summary

1.1 The livestock master plan and its support to the Gambia's livestock sector

The livestock sector is predominant in the livelihoods of the population of the Gambia, with cattle and chickens as the most reared species in the country. The livestock sector in the Gambia contributed 13.8% of the agricultural gross domestic product (GDP) and 2.6% of the overall GDP in 2019. However, the livestock sector is bedevilled by a plethora of challenges including lack of access to feed, fodder and water; disease outbreaks; limited veterinary services; a low level of market linkages; and lack of improved germplasm. Despite these challenges, there are potential growth opportunities. The Small Ruminant Production Enhancement Project (SRPEP) was commissioned to address some of the challenges of the livestock sector, and this livestock master plan (LMP) is one of the project's key deliverables.

The LMP is a five-year plan expected to serve as a blueprint to increase support for the livestock sector by attracting more targeted investment from finance ministries, development partners and the private sector. The roadmaps in the LMP highlight the vision, targets, challenges, opportunities, strategies, recommended technology and policy investments, and the expected outcomes in relation to Gambia's development objectives. The Gambia LMP was developed by scientists at the International Livestock Research Institute (ILRI) in collaboration with experts from the Department of Livestock Services (DLS) and district officers, upon request from the Government of the Gambia and through funding from the Islamic Development Bank. The LMP was reviewed by a Technical Advisory Committee chaired by the SRPEP project.

The recommendations of the roadmaps are based on the conclusions from a livestock sector strategy, which explored the impact of proposed interventions in response to value chain problems related to animal feed and fodder, breeds, diseases and marketing. Cumulatively, the proposed intervention amounts to USD 44.2 million¹, with 75% of the amount coming from public funding and 25% expected from the private sector. Overall, the interventions aimed at improving animal health account for the largest share (35%) of the total investment budget. This is followed by education, research and extension service interventions at 33%, feed and feeding interventions at 14%, interventions for genetic improvement at 10%, and marketing interventions at 8%.

This report highlights the roadmaps for three livestock value chains – cattle, small ruminants (sheep and goats) and chickens – earmarked for the five years from 2023 to 2027. The key highlights discussed in the report cover the main interventions to improve the livestock sector and the projected impact of these interventions.

1. The exchange rate used for a USD is 60 GMD

1.2 Key highlights of the cattle value chain roadmap

The interventions proposed (in collaboration with stakeholders and experts in the Gambia) for the improvement of the cattle value chain in the Gambia address challenges pertaining to feed and fodder, animal health, genetic improvement, education, research and extension services, and marketing investments.

1.2.1 Key interventions for improving the cattle value chain

Policy and legislation interventions: Four policy and legislation interventions designed to increase the availability of feed for cattle and small ruminants are (i) the development of an implementation plan to operationalize the Forest Act 1998 to ensure sustainable exploitation of range resources within designated areas; (ii) the completion of the 'comprehensive/systematic monitoring and inventory of the available range resources and carrying capacity of the rangelands' conducted in 1986 by the United States Agency for International Development (USAID)-funded Mixed Farming and Resource Management Project for the Central River Region North, Central River Region South and Upper River Region to include all production zones and feed and fodder resources; (iii) the limitation of export of processed feed ingredients; and (iv) allocation of concessional supply for local livestock producers. For the genetic improvement of cattle in the Gambia, the development of a cattle breeding policy within two years has been outlined, along with the development of livestock extension policy guidelines and a legal framework within three years.

Training and sensitization interventions: The main sensitization and training interventions for feed improvement cover topics on the prevention and control of bushfires, planting of fodder and fodder trees as fences, harvesting green feeds during the wet season and conserving them for use in the dry season. Other sensitization and training topics are on the regeneration of degraded grazing areas and rangelands via the construction of access and slipways to rivers.

The outlined training and sensitization interventions to improve the health conditions of livestock include the revision of the curriculum to train livestock technicians, training of laboratory technologists and technicians of the Central Veterinary Laboratory, building the capacity of trainers, provision of teaching materials and equipment for the Livestock Training School of the Gambia College of Agriculture, and strengthening the monitoring and regulation capacity of the veterinary council and the training of staff on disease surveillance and monitoring. Sensitization of farmers on the selection and retention of good breeding bulls and heifers is also planned to support the genetic improvement of cattle in the Gambia. Notable is the planned expansion of the sensitization on the N'Dama breeding program. Also, refresher courses on artificial insemination (AI) for technicians and para-vets, together with the provision of requisite equipment and supplies to the trained AI technicians, have been planned for implementation.

Disease control interventions: The interventions outlined to improve the health conditions of cattle in the Gambia include increasing the overall vaccination coverage of contagious bovine pleuropneumonia from 75% to 80%, and of haemorrhagic septicaemia, black quarter and lumpy skin disease to 30%, within the five years from 2023 to 2027, and full coverage in commercial dairy farms; and increasing anti-parasite treatment to 30% and anthelmintic use to 40% within the five years.

Infrastructural development: The outlined infrastructural investment aimed at improving the health conditions in the cattle value chain in the Gambia includes: (i) the establishment and provision of equipment for 53 new veterinary stations and improving the infrastructural conditions of six veterinary laboratories; (ii) the construction of 70 boreholes and the development of 40 low-lying areas planned to ensure access to water for forage and feed production; (iii) the establishment and strengthening of Regional Diagnostic Laboratories and the Central Veterinary Laboratory for effective disease surveillance and the monitoring of vaccinations against contagious bovine

pleuropneumonia and other transboundary animal diseases; and (iv) the enhancement of cold chain maintenance for proper storage of vaccines, reagents and laboratory samples collected for confirmatory diagnosis.

For genetic improvement, the construction of one AI centre in the first year and one liquid nitrogen storage facility within the five years, as well as upgrading the four existing training centres and four demonstration units, have been planned for implementation.

For improving the marketing process in the cattle value chain, these infrastructural developments are outlined for implementation within the five years: fencing of holding grounds; provision of watering facilities, slaughter slabs and cold storage facilities; provision of market information systems in ten primary markets and two terminal markets; and modernization of the ten existing slaughterhouses.

Provision of government subsidies: For genetic improvement, it is planned that the government will subsidize private AI service providers and private veterinary experts to establish veterinary pharmacies and input shops. To improve the marketing and processing activities, it is planned that the government will provide subsidies to private actors to establish small-scale milk processing plants and modern abattoirs within five years.

1.2.2 Projected impacts for implementing interventions

Projections of the impact of the implementation of the outlined interventions include:

- 10.4% increase in the N'Dama cattle population (from 289,857 to 320,025 cattle) in five years (2023–2027).
- 11.3% increase in the Zebu/Gobra cattle population (from 6,701 to 7,399 cattle) in five years (2023–2027).
- 38.8% increase in total beef production (from 4,073 tonnes in the base year to 5,655 tonnes in 2027) under an investment scenario where various cattle improvement interventions are implemented.
- N'Dama breeds will contribute 97% of the projected increase in total beef production.
- 116.7% increase in milk production (from 20.17 million litres in 2023 to 43.72 million litres in 2027).
- N'Dama breeds will contribute 83.6% of the total milk production
- Manure production and draught power are projected to increase by 11% and 12.2% respectively from 2023 to 2027.
- The contribution of cattle products to GDP is projected to increase by 4%, from 4.182 billion Gambian Dalasi (GMD) in 2023 to GMD 4.347 billion in 2027.
- Estimated investment cost for improving the cattle value chain

To achieve the projected impacts in the cattle value chain, a total of USD 36,970,809 is estimated for the interventions outlined to be implemented within the five years (2023–2027). Out of the total investment cost, 15% is expected to come from the private sector other sources and the remaining 85% from public funds. Figure 1 presents an overview of the estimated budgetary allocation for interventions proposed to help improve the cattle value chain in the Gambia. The highest estimated budgetary allocation (39%) is planned for interventions that will improve education, research and extension services in the Gambia. The remaining estimated budgetary allocations in decreasing order are for animal health (33%), animal feed (12%), genetic improvement (9%) and marketing investment (7%) interventions.

Most of the private-source funds (43%) will be allocated to improve the animal feed interventions. The estimated budgetary allocation for education, research and extension service interventions is the second highest (36%) of privately sourced funding. Therefore, for the next five years, the Gambian government can facilitate the enabling environment for investments targeted at improving animal feeding, education, research and extension services.

Figure 1: Estimated budgetary allocation to improve the cattle value chain, 2023–2027.

1.3 Key highlights of small ruminant (sheep and goats) value chain roadmap

The feed and health improvement interventions described above for the cattle value chain generally apply to the small ruminant value chain as well. However, some interventions are specific to the small ruminant value chain for the five years (2023–2027). These interventions include:

1.3.1 Key interventions for improving the small ruminant value chain

Policies and legislation intervention: Develop a breeding policy for sheep and goats in the next three years to support genetic improvement.

Disease control interventions: Implement a routine mass vaccination (80% vaccination coverage) against peste des petits ruminants (PPR) and pasteurellosis, and routine deworming campaigns (up to 60% of total sheep and goats).

Provision of government subsidies: Provide matching grants for USD 2,000 as seed capital for the establishment of private breeding farms and provide a 40% subsidy for commercial farms to implement zero-grazing schemes.

Organizational structure development: Provide resources to strengthen the local breed improvement activities conducted by the West Africa Livestock Innovation Centre (WALIC).

Infrastructural development: Construct adequate marketing facilities at the level of the weekly markets at Sare Ngai, Sare Bojo, Brikamaba, Wasu, Jareng, Samitenda, Farafeni, Bureng, Kerr Pateh, Ndugukebbah, Fass Njaga Choi and Panchang with fencing for livestock holding grounds, watering facilities, sheds, toilets and loading ramps. Also, the construction of two more terminal markets in the coming five years is an infrastructural development intervention targeted at improving marketing and processing in the small ruminant value chain.

1.3.2 Projected impacts for implementing interventions

Results of the LMP analysis indicate the following impact after implementing the interventions for the small ruminant value chain:

- 54% increase in goat meat production (from 1,125 tonnes to 1,736 tonnes)
- 59% increase in sheep meat production (from 504 tonnes to 803 tonnes)
- 27.6% increase in total goat population (from 367,126 to 468,556) within five years (2023–2027)
- 28% increase in the total sheep population (from 191,540 to 244,459) within five years (2023 to 2027).
- Estimated investment cost for improving the small ruminant value chain

A total of USD 1,550,345 is budgeted for the interventions outlined to be implemented within the five years (2023–2027) to achieve the impacts in the small ruminant value chain. Out of the total investment cost, 39% is expected to come from the private sector among other sources while the remaining 61% will be from public funds. A summary of the estimated budgetary allocation for interventions proposed to help improve the small ruminant value chain in the Gambia is shown in Figure 2. The highest estimated budgetary allocation (40%) is planned for interventions that will improve the availability of feed and forage for small ruminants in the Gambia. The remaining estimated budgetary allocations are for marketing investment (29%), genetic improvement (22%) and animal health interventions (9%). No budget is allocated for education, research and extension services because the estimated budgets are accounted for in the budgets for the cattle value chain.

Most of the privately sourced funds (53%) will be allocated to marketing investments. The estimated budgetary allocation for interventions to improve the availability of animal feeds is the second highest (34%) among privately sourced funds. Therefore, within the next five years, the Gambian government can facilitate the enabling environment for marketing investments and investments targeted at the animal feed industry.

Figure 2: Estimated budgetary allocation to improve the small ruminant value chain, 2023–2027

Proportion of estimated budgetary allocation
2023–2027

1.4 Key highlights of the chicken value chain roadmap

The health interventions listed under the cattle value chain apply to all other livestock value chains. However, some interventions are specific to the chicken value chain in the Gambia.

1.4.1 Key interventions for improving the chicken value chain

Policy and legislation interventions: Enactment of regulations and acts to discourage the export of brans and oil seed cakes outside the country within three years is planned to improve the availability of chicken feed in the Gambia. For genetic improvement, the development of a backyard indigenous chicken breeding policy is outlined for implementation in the next two years.

Training and sensitization interventions: Farmers will be trained on the utilization of locally available feed supplements and different possible feed ration formulas to improve the chicken feeding situation in the Gambia. Also, training manuals on backyard indigenous chicken improvement will be developed and farmers will be trained within the five years.

Disease control interventions: To improve the health of chickens, vaccination against Newcastle disease and fowl pox is planned for 65% of the backyard chicken population by the end of 2027, and the percentage of farmers applying internal and external parasite treatments will be increased to 65% by the end of 2027.

Infrastructural development: The government will create veterinary outlets (pharmacies) and cold storage facilities for vaccines to improve access to medication and benefit multiple livestock species.

Organizational development: To improve the marketing activities in the chicken value chain, the government will support the establishment of cooperatives for producers with indigenous chicken breeds. To improve food safety in the value chain, the government will promote contracts between hatcheries and parent stock farmers.

Provision of government subsidies: The government will provide funding for the establishment of one commercial chicken parent stock farm.

1.4.2 Projected impacts for implementing interventions

Implementation of the outlined interventions will result in the following impacts:

- 315% increase in poultry production (from 1,228 metric tonnes to 5,096 metric tonnes) within the five years
- 25% increase in egg production from backyard indigenous chickens within the five years
- 208% increase in the contribution of the backyard indigenous chickens within the five years
- Total GDP contribution to increase from GMD 82.7 million to GMD 284.47 million within the five years.

1.4.3 Estimated investment cost for improving the chicken value chain

A total of USD 5,721,830 is budgeted for the interventions outlined to be implemented within the five years (2023–2027) to achieve the impacts in the chicken value chain. Out of the total investment cost, 84% is expected to come from the private sector and other sources, and the remaining 16% is from public funds. A summary of the estimated budgetary allocation for interventions proposed to help improve the chicken value chain in the Gambia is shown in Figure 3. The highest estimated budgetary allocation (54%) is planned for interventions geared at improving health

conditions in the chicken value chain in the Gambia. Most of the privately sourced funds (62%) will be allocated to animal health improvement interventions. This is followed by interventions aimed at genetic improvement (16%) and interventions to improve the availability of chicken feed (13%).

Figure 3: Estimated budgetary allocation to improve the chicken value chain, 2023–2027.

In sum, to increase the livestock sector GDP, household income and availability of livestock products, the government will have to create an enabling environment that incentivizes private sector investment in specific sectors. For the cattle value chain, private investment targeted at the feed industry, research and development should be supported by the government. For the improvement of the small ruminant value chain, marketing investments and investment in the animal feed industry by the private sector should be key. Finally, for improvement in the chicken value chain, the government's support should be tailored towards private investments that seek to improve the health conditions in the chicken value chain in the Gambia.

2 Introduction

Agriculture is one of the vital sectors of the Gambian economy. It employs about 70% of the labour force (Government of the Gambia 2019), with about 32% of the labour force in active primary agricultural production which involves the production of raw produce (FAO et al. 2018). The agriculture sector's contribution to GDP has been declining since 2013, and it contributed about 21.7% to the country's GDP in 2019 (The Gambia Bureau of Statistics 2022). The performance of the agricultural sector has key implications for poverty reduction and food security (FAO et al. 2018) because approximately 40% of the population lives in rural areas, where 73.9% live below the poverty line (IFAD 2022). Despite the importance of agriculture to most of the population, the sector has continued to underperform compared to the other sectors of the economy, particularly the services sector. According to IFAD (2019), the underlying reasons for the low performance of the agricultural sector are, among others, little diversification, the subsistence nature of agricultural production, the over-reliance on rainfed production, low productivity due to the over-reliance on traditional systems of production, and the existence of many small independent farming units. Most of these farmers also lack the requisite knowledge, skills and access to productive resources such as credit, land ownership and support services to enhance their production (IFAD 2022). The sector's exposure to shocks has necessitated significant food imports with the scarce foreign exchange available to meet rising food demand.

The livestock sector remains a predominant sector in the livelihood of the population of the Gambia, with cattle and chicken as the most reared species in the country. The livestock population in 2020 was estimated at 285,000 cattle, 177,000 sheep, 378,000 goats and 982,000 chickens (The Gambia Bureau of Statistics 2022). Official figures indicate that the livestock sector alone contributed 13.8% to the agricultural GDP and 2.6% to the overall GDP of the Gambia in 2019 (The Gambia Bureau of Statistics 2022). The contribution of livestock has been declining annually in absolute and relative terms, mainly due to the traditional production systems used and the fact that the sector's huge potential remains underexploited (The Gambia Bureau of Statistics 2022). The livestock sector is characterized by low productivity per animal, the presence of disease vectors, and inadequate access to inputs such as feed and veterinary and extension services, which have all contributed to the underperformance of the sector and the inability to meet the growing demand for animal-sourced foods (Olaniyan 2017).

To boost the livestock sector, the Government of the Gambia, as a matter of policy, has prioritized livestock production in its development agenda. The purpose is to facilitate the process of commercializing and modernizing the livestock sector; strengthen selected institutions to deliver needed services; support the livestock sector for increased production; and diversify the livestock production base (Touray 2016). The Small Ruminant Production Enhancement Project (SRPEP), for example, aims to improve the livelihoods of livestock-producing households by improving the productivity of local breeds through better feeding and husbandry practices, fostering greater access to veterinary services and production infrastructure, supporting production and marketing management, enhancing innovations in product/processing techniques, and facilitating access to Islamic finance through a revolving fund.

This livestock master plan (LMP) is an important component of the SRPEP and is meant to guide the ongoing project and the Department of Livestock Services (DLS) to enhance the provision of additional public and private investments

in the livestock sector and improve livestock contributions to achieving the development goals stated in the National Development Plan (NDP), such as transforming the sector to improve livelihoods, employment (particularly for youth) and national income.

2.1 Livestock master plan (LMP) to support the Gambian livestock sector

To increase the support for the livestock sector, the Government of the Gambia developed an LMP that includes a thorough and systematic analysis of the Gambian livestock sector, a livestock sector strategy (LSS) and value chain-specific investment roadmaps. The investment roadmaps constitute a detailed five-year livestock sector investment plan meant to help increase and better target public and private investments. The purpose of producing an LMP and investment roadmap is to attract more substantial and better-targeted livestock sector investments from finance ministries, development partners and private sector investors. To help raise public and private investment and allocate more budget to the livestock sector, the Government of the Gambia, through the Islamic Development Bank, requested that the International Livestock Research Institute (ILRI) provide technical assistance in developing a comprehensive LMP (Bahta et al. 2022).

The Gambia LMP was undertaken by a team of experts from Gambian government institutions (DLS, veterinary college, district officers) along with ILRI livestock and planning experts.

A Technical Advisory Committee chaired by the SRPEP project manager reviewed and made recommendations related to ensuring progress in achieving the outputs of the LMP project. Once completed, the commodity value chain investment roadmaps of the LMP were also reviewed by eminent livestock scientists of ILRI and an external reviewer and were found credible and defensible. The roadmaps presented here are a series of five-year investment plans for the development of priority livestock value chains, chosen through sector analysis and based on their potential for impacting the development objectives of the Government of the Gambia. Each roadmap includes a specific vision and targets, challenges and opportunities, strategies, and recommended technology and policy investment interventions, with expected outputs, impacts and outcomes for the Gambia's development objectives. The roadmaps include detailed budgets and sequenced activity plans (or Gantt charts). The findings of the livestock sector analysis, profitability analysis of investing in halal slaughterhouses, and the Gambia LSS are presented in separate publications.

This livestock master plan with investment roadmaps is organized into six sections. Section one was the executive summary which presented key highlights, and section two is the introduction. Sections three to five present the roadmaps for the three value chains (cattle, small ruminants and chickens) for 2023–2027. Each section begins with the vision of the value chain and analysis of investment scenarios. The sections also critically analyse each value chain in terms of production systems, opportunities that exist in the value chain, an analysis of interventions to improve each value chain, and their implementation budgets. An analysis of the impact of the interventions, budgets, and implementation timelines for each value chain (presented in the annexe tables) is also explained in these sections. Finally, section six presents the contribution of the LMP in terms of its value to the livestock budget planning of the Government of the Gambia.

3 Cattle value chain roadmap (2023–2027)

3.1 A summary of results and conclusions from the 15-year livestock sector strategy (LSS)

Cattle rearing is one of the most important activities in the livestock sector (Touray 2016). Cattle are reared in all the administrative regions, but production is concentrated in the rural areas. The systems of cattle production include (i) the extensive system, which is the most predominant and involves mixed crop–livestock farming, usage of indigenous breeds of low productivity (N'Dama and Zebu/Gobra), and transhumance and internal migration in search of pastures and water during the dry season; (ii) the semi-intensive system, where selected animals (including draught animals) are given supplementary feeds using agro-industrial by-products and crop residues to increase meat, milk, manure and draught power; and (iii) the intensive system, practised mainly in the urban and peri-urban areas using pure-breds (mostly European breeds) and crosses of N'Dama and European breeds to increase the productivity of both milk and meat.

Rearing of cattle in the Gambia faces numerous challenges and constraints, including poor feeding, low productivity of the traditional breeds, limited processing infrastructure, livestock diseases, and a dysfunctional marketing system (Touray 2016). The lack of access to feed is associated with both limited production and high costs of feed. Feed production is limited due to severe rangeland degradation due to overgrazing, climate change, recurrent bushfires and the absence of improvement strategies; seasonality – with dry periods being characterized by an acute scarcity of feed and water; and dwindling rangeland resources due to demographic pressure and the lack of policy and legal frameworks for the protection and sustainable management of grazing lands and cattle tracks. Concentrate feed costs are high in the Western Region, where dairy production is more prevalent. Frequent occurrence of diseases also leads to economic losses and is exacerbated by a critical shortage of veterinarians in the public sector and a significant lack of favourable policy for the promotion and support of private veterinary services for the delivery of animal health care services (Rich et al. 2020). The problem of a largely dysfunctional marketing system relates to poor market infrastructure together with market imperfections and lack of a coordinated value chain and undermines performance and growth.

To improve the cattle production system as well as the income of small and marginal farmers, the activities that need to be implemented were identified in the LSS (see Bahta et al. 2023).

The set of interventions to address the challenge of lack of feed include:

- Complete the “comprehensive/systematic monitoring and inventory of the available range resources and carrying capacity of the rangelands” conducted in 1986 by the United States Agency for International Development (USAID)-funded Mixed Farming and Resource Management Project for the Central River Region North, Central River Region South and Upper River Region to include all production zones and feed and fodder resources.

- Facilitate the adoption of collection, storage and utilization of groundnut hay, maize, millet stover and rice straw for livestock feeding during the latter part of the dry season.
- Promote the production of drought-resistant forages.
- Support the utilization of by-products such as groundnut cake, cotton seed cake, sesame cake and rice and millet brans, especially in milk-producing areas.
- Continue the promotion of compost pens and other stabling techniques as a way of enhancing milk production.

For genetic improvement, the LSS recommended:

- Broaden, strengthen and sustain the 3-Tier National Breeding Program (nucleus, multiplier, village/farmer) being implemented by the DLS and West Africa Livestock Innovation Centre (WALIC), and implement a long-term planning and strategic breeding program.
- Promote sustainable use, development and conservation of indigenous animal genetic resources to reverse the trend of erosion of cattle genetic resources.
- Conduct bio-morphometric and molecular characterization of the N'Dama breed as well as phenotypic characterization.
- Initiate a national artificial insemination (AI) program both for indigenous breeds and pure-bred European breeds being used in the dairy industry, particularly in the Western livestock production zone.
- Establish a cadre of well-trained geneticists and technicians.
- Provide refresher courses on AI for technicians and para-vets together with the provision of requisite equipment and supplies to the trained AI technicians.

To address the challenge of diseases, it was recommended to:

- Seek technical assistance from Commonwealth member countries (as was the case in the past) to address the current shortage of veterinarians, and explore the possibility of employing retired Gambian vets on contract while prioritizing the training of vets in the long term.
- Enhance private participation in the delivery of veterinary healthcare.
- Establish and strengthen Regional Diagnostic Laboratories and the Central Veterinary Laboratory for effective disease surveillance and the monitoring of vaccinations against contagious bovine pleuropneumonia (CBPP) and other transboundary animal diseases.
- Enhance cold chain maintenance for proper storage of vaccines, reagents and laboratory samples collected for confirmatory diagnosis.

To address the problems in marketing, the recommendations included:

- Develop improved market infrastructure and facilities for the collection, storage, processing and transportation of milk in the Western Region.
- Construct a modern abattoir and meat processing plants in the Western Region.
- Support and engage with women involved in the informal marketing of milk and milk products in forming cooperative societies and working closely with the mini dairies in the Central and Eastern regions.
- Initiate a program for the building of modern slaughterhouses and slabs in rural areas in the Central and Eastern regions.

Results of the foresight analysis on the impact of the proposed additional investments – comparing a scenario with additional investment (WI) versus business as usual (BAU) – indicated that:

- Quantities of beef and milk produced are projected to rise by only 3% and 5%, respectively, under BAU, compared to an increase in the level of consumption of 38% and 78%, under WI. Under the BAU scenario, much of the slaughter stock for the country will continue to be imported from neighbouring countries to satisfy demands. With the investments, the projected beef production will surpass projected consumption between the base year (2022/23) and 2037/38.
- The percentage share of domestic production to total consumption is projected to fall from 49% to 29% for milk and 77% to 57% for beef under BAU.
- In the WI scenario, milk and beef production from the base year to 2037/38 is projected to increase by 336% and 105%, respectively.
- Milk production in the BAU scenario is projected to be significantly below the consumption level, and satisfy only about 50% of the consumption requirement of the country by 2037/38. With the WI scenario, milk production is projected to increase by 76% from the base year to 2037/38 and close the milk deficit by 2034.

3.2 Five-year vision for the cattle value chain

The vision is to increase income from cattle for farmers adopting cattle improvement interventions and raise the country's beef and cow milk production from the current 4,100 tonnes and 20.2 million litres to about 5,700 tonnes and 43.7 million litres, respectively, by 2027. The contribution of beef and cow milk to the Gambia's GDP will increase from 689 and 545 million Gambian Dalasi (GMD) by 2022 to GMD 723 and 1,288 million by 2026/27, respectively.

3.3 Description of cattle production systems

The cattle value chain comprises mainly indigenous N'Dama cattle but also includes crossbreds with Zebu cattle (known as Gobras), crossbreds with European cattle and pure-bred European cattle. The overwhelming majority of all cattle (98%) in the Gambia (286,220 head) are N'Dama breeds. The remaining 2% comprise Zebus, Gobras and crossbreds of N'Dama with Jersey, Holstein-Friesian and other European breeds (National Livestock Census 2016).²

N'Dama cattle are dual-purpose animals producing both milk and meat. The average milk yield is between 1.5 and 3.5 litres depending on the season (about 3.5 during the rainy season and 1.5 during the dry season). The average milk yield for crossbred cows is about 10 litres per day and for European breeds about 20 litres per day depending on management practices. The average herd size for N'Dama cattle is 56 while for crossbreeds and European cattle, is 20.

Across all the production zones (Western, Central and Eastern) the predominant production system for N'Dama cattle is the extensive system that is characterized by free-range grazing and minimal supplementation. However, in the Western production zone, European breeds and their crosses in the smallholder commercial dairy production system are found in peri-urban areas under semi-intensive to intensive management. In these dairy systems, various forms of housing, zero grazing, grazing with supplementation, and inputs for disease control are provided. Individual animals are tagged, and some production records are maintained. Milk produced is also sold either raw or as fresh pasteurized milk or yoghurt.

2. As the most recent census, the 2016 census was used to derive the base year parameters and validated by the National Technical Committee.

3.4 Opportunities, challenges and strategies

The cattle subsector constitutes a valuable resource, the potential of which is however underutilized, and remains an important complementary attribute of the farming and livelihood support system of most rural and peri-urban households in the country.

In this regard, cattle production forms an integral component of the agro-pastoral mixed farming system, providing manure, milk, meat and a source of income for satisfying sociocultural and other obligations.

The subsector is faced with several challenges including feed shortages, disease outbreaks, lack of improved germplasm, and market constraints. These constraints are compounded by shrinking rangelands (due to demographic pressures resulting in the cultivation of marginal lands that were hitherto reserved as pastures) and inadequate access to credit and veterinary infrastructure.

However, intensification of the cattle management and production systems will provide opportunities for the enhancement of the development of the beef and peri-urban dairy industry to boost domestic milk production to meet the growing demand for dairy products in the expanding tourism sector and urban and growth centres.

As mentioned earlier, opportunities exist for the expansion of the commercial dairy industry in the Western production zone given that the agroecological conditions favour the utilization of crossbreeds and European breeds of cattle. In addition, there is considerable access to feed and water and high demand for livestock and livestock products due to the high densities of a predominantly urbanized population in the area.

3.5 Investment scenarios analysed in the five-year investment plan

The cattle improvement investments for the first investment period (five-year investment roadmap) are analysed for the BAU and WI scenarios. The BAU scenario represents the base case or existing scenario with the analysis showing the impacts of continuing the current type and level of investment and recurrent spending on meat and milk production, income per animal and contribution to GDP throughout the LMP analysis period of five years. The WI scenario represents an increase in the investments in N'Dama and Zebu/Gobra cattle to improve meat and milk production, income per animal and contribution to GDP through increasing productivity and the population of crossbreed cattle. This scenario ultimately aims to meet the country's milk and meat consumption requirements.

3.6 Overall livestock master plan targets under the intervention scenario

3.6.1 Overall targets at the production zone and country level

The population of cattle under an investment scenario of implementing the improvement interventions under cattle is projected to increase by 11.3%, from 296,889 in the base year to 330,390 in 2027 (Table 1). N'Dama cattle are projected to make up about 97% of the entire cattle population in the Gambia compared to 0.9% from the commercial dairy system and 2.2% from Zebu/Gobra crossbreeds. The commercial dairy cattle population is projected to increase by 794.7%, from 332 in 2022 to 2,966 in 2027. The Eastern production zone is projected to produce the most cattle, comprising 55.6% of the population in 2027, whereas the Western zone will comprise 12.7% of the population by 2027.

Table 1: Cattle population targeted for five years under the scenario with additional investment (WI)

Production zone	Sub-system	Livestock population WI scenario						
		Base year 2022	2023	2024	2025	2026	2027	% Change
Western	N'Dama	37,363	38,110	38,872	39,650	40,443	41,252	10.4%
	Zebu/Gobra	764	779	794	810	827	843	10.4%
	Total	38,126	38,889	39,667	40,460	41,269	42,095	10.4%
Central	N'Dama	89,366	91,154	92,977	94,836	96,733	98,668	10.4%
	Zebu/Gobra	2,642	2,695	2,749	2,804	2,860	2,917	10.4%
	Total	92,009	93,849	95,726	97,640	99,593	101,585	10.4%
Eastern	N'Dama	163,128	166,390	169,718	173,112	176,575	180,106	10.4%
	Zebu/Gobra	3,295	3,361	3,428	3,497	3,567	3,638	10.4%
	Total	166,423	169,751	173,146	176,609	180,142	183,744	10.4%
Commercial dairy	Small	332	514	796	1,234	1,913	2,966	794.7%
Total population	N'Dama	289,857	295,654	301,567	307,598	313,750	320,025	10.4%
	Zebu/Gobra	6,701	6,835	6,972	7,111	7,253	7,399	10.4%
Grand total population		296,889	303,306	309,861	316,558	323,400	330,390	11.3%

Source: The Gambia LMP analysis

3.7 Cattle improvement interventions

3.7.1 WI scenario – dairy improvement targets and interventions³

3.7.1.1 Feed interventions

According to DLS and FAO (2022), in the Gambia, there is surplus feed production in terms of dry matter in the rainy and cold dry seasons. However, the amount of feed produced in the hot dry season decreases substantially. In the dry season, the amount of feed produced in the country is not enough to satisfy the needs of livestock. The energy balance (available vs. need) also follows a similar trend (Bahta et al. 2022). The following proposed interventions can improve the feed production and need balance in the country:

- The DLS with the Department of Forestry should produce a detailed implementation plan to ensure sustainable exploitation of range resources within the designated areas. This is necessary even though the Forest Act 1998 (in accordance with Section 68 of this Law) allows for forest grazing in designated community forests.
- The Ministry of Agriculture should engage other relevant stakeholders (such as the Ministries of Local Government and Lands, Justice, Forestry and the Environment and Parks and Wildlife, Civil Society and Community Leaders) to update the Land Use Plan taking into consideration the urgent needs of the agriculture and livestock sectors in the country. The last comprehensive Land Use Plan for the Gambia was developed in 1985, and it was followed by the preparation of the Physical Development Plan for the Greater Banjul Area in 2000.
- Demarcate, map and gazette grazing areas and stock routes within the first four years of the LMP period to decrease conflicts between farmers and livestock herders.
- Sensitize and train farmers on the prevention and control of bushfires.
- Regenerate degraded grazing areas and rangelands using community-based grazing area and rangeland management systems, including:
 - Over-sowing of palatable feed species, including *Adropogon gayanus* and *Panicum* and *Brachiaria* species

3. For more details on recommended interventions for each value chain, refer to Bahta et al. (2022) and Bahta et al. (2023).

- Construction of access and slipways to rivers in 20 areas that currently have low access for animals
- Construction of 70 boreholes with the contribution of herd owners
- Development of 40 low-lying areas (manmade and natural depressions) and improvement of water harvesting
- Planting of fodder tree species such as *Pterocarpus erinaceus*, *Leucocephala*, *Acacia albida* and *Leucaena* in community forest parks and rangelands and around boreholes and slipways.
- Sensitize and provide incentives for farmers to grow fodder and fodder trees as fences and hedges in backyards and other areas to supplement cattle and enhance feed availability during the dry season.
- Sensitize farmers to supplement lactating cows with concentrate feeds, salt and mineral licks, to increase the proportion of cattle farmers that supplement their lactating cows with some form of concentrate feed to 50% by the end of the five years of the LMP period (2027).
- Increase the use of leguminous plants, e.g. *Pterocarpus erinaceus*, *Acacia albida* (*Faidherbia albida*) and *Cajanus cajan*.
- Liaise with the National Seed Secretariat to have a strong fodder seed quality regulatory department within the Secretariat.
- Sensitize and provide incentives for farmers to harvest green feeds during the wet season and conserve them for use in the dry season.
- Train farmers in collecting, preserving and utilizing crop residues. Currently, crop residue utilization in the Gambia is very low for many crops except for groundnut and cowpea which have a very high crop residue utilization.
- Improve the availability of government and private sector professionals supporting dairy farming and milk processing by increasing the accessibility of long-term training on dairying and milk processing.
- Limit the export of processed feed ingredients and have a concessional supply for local livestock producers.
- Facilitate financial provision and long-term loan repayment schemes to commercial dairy farms that want to establish and operate dairy farms.
- Encourage the establishment of a fodder and fodder seed producers' association within three years.
- Improve the linkages with feed and fodder associations in other countries like Mali and Senegal.

3.7.7.2 Health improvement interventions:

- Vaccinate cattle for priority diseases like CBPP, haemorrhagic septicaemia (HS), black quarter (BQ) and lumpy skin disease (LSD). The vaccine coverage of CBPP is targeted to increase from the current coverage of about 75% (DLS 2020) to about 80% in the coming five years. The percentage of cattle vaccinated against HS, BQ and LSD is targeted to increase from the current coverage of very low (DLS 2020) to 30% by the end of the five years (2023–2027).
- Vaccinate dairy cattle against CBPP, HS, BQ and LSD on commercial farms, and continue anthrax vaccination and chemoprophylaxis against tick-borne and blood-parasitic infectious diseases.
- Increase the rate of anti-parasite treatment to 30% and anthelmintic use to 40% by the end of the five years (2023–2027). The current level of external and internal parasite treatment practices among N'Dama cattle owners is about 15% and 25%, respectively, using anti-parasite chemicals and anthelmintic (DLS 2020).
- Strengthen the Veterinary Council within four years to make it able to effectively monitor and regulate the importation, distribution and use of veterinary drugs.

- Ensure the availability of sufficient vaccines and medicines in the country.
- Strengthen the Livestock Training School of the Gambia College of Agriculture through capacity building of trainers and provision of teaching materials, equipment and protective clothing for trainees, and provide laboratories and practical facilities and equipment throughout the LMP duration.
- Revise the current curriculum used to train livestock technicians, within two years.
- Train veterinarians and livestock technicians to scale up their capacity and increase their contribution to the improvement of extension and veterinary service delivery.
- Establish five additional veterinary pharmacies and drug outlets in the regions in the five years (2023–2027) of the LMP duration.
- Strengthen the existing six regional veterinary stations by improving infrastructure and providing equipment within the five-year LMP.
- Improve infrastructure, provide equipment and hire experts to open positions for the existing 53 veterinary sub-stations.
- Establish 53 new veterinary sub-stations (one more for every district) within the five-year duration of the LMP (2023–2027).
- Strengthen the disease surveillance system by improving staff capacity with training and the monitoring system.
- There are currently 82 farmers' sanitary defence committees. It is recommended to build the capacity of existing sanitary defence committees and raise their number to 120 by the end of the LMP period (2027).
- Improve the capacity of the existing six Regional Veterinary Laboratories in the coming five years by improving infrastructure, equipment, staffing and staff capacity.
- Improve the facilities and train laboratory technologists and technicians of the Central Veterinary Laboratory at Abuko.

3.7.7.3 Genetic improvement interventions:

- Produce a cattle breeding policy within two years
- Sensitize herd owners on the selection and retention of good breeding bulls and heifers in the local herd. It is targeted to sensitize 60% of livestock farmers by the end of five years (2023-2027).
- Expand the N'Dama breeding program being conducted by WALIC and produce and distribute elite breeding bulls to farmers through the Gambia Indigenous Livestock Multipliers Association (GILMA). It is targeted that 5% of cattle farmers in the country will have access to elite N'Dama breeding bulls/semen by the end of five years (2023-2027).
- Strengthen the capacity of WALIC by coordinating and facilitating funds for the construction of more barns, the purchase of more animals, and improved research and training facilities. Also, it is equally essential to provide enhanced laboratory and storage facilities and equipment to expand the laboratories' capacity to include handling breeding materials and activities.
- Construct one AI centre within the first five years of the LMP period. The AI centres will produce semen straws from elite N'Dama bulls and exotic/exotic-cross breed bulls.
- Construct one liquid nitrogen storage facility within five years.
- Train 100 additional AI technicians within five years (2023-2027).
- Subsidize private AI service providers to help them expand their AI service to more livestock producers.

3.7.7.4 Extension and research improvement interventions:

- Develop livestock extension policy, guidelines and legal framework for extension services within three years.
- Strengthen the capacities of the livestock research section of the National Agricultural Research Institute (NARI) by improving the research facilities and staffing with livestock researchers and scientists to make it able to conduct livestock research. The research institute must also collaborate with other research institutions like WALIC and others in the subregion.
- Coordinate and facilitate the provision of financial support, the necessary equipment, and training opportunities to the staff of WALIC to expand its local cattle improvement program and other research.
- Enhance the mobility of the public extension service providers to allow them to interact more effectively with farmers.
- Strengthen DLS and other stakeholders' livestock data collection tasks by providing appropriate equipment, in addition to capacity building and training on data collection (methods and tools) and analysis.
- Improve staff retention at NARI, WALIC and DLS through incentives, career progression opportunities and scholarships.
- Upgrade the existing training centres and demonstration units and utilize them to full capacity. The existing four training centres and four demonstration units cater to all species in the country.
- Improve infrastructure, equipment, and staffing at 53 veterinary sub-stations and construct an additional 53 new veterinary sub-stations (one for every district) within the LMP period.
- Promote private veterinary and extension service providers by subsidizing veterinary and livestock experts to establish veterinary pharmacies and input shops that can provide farmers with veterinary and extension services.
- Support private extension service provider startups through appropriate subsidies.
- Regulate private veterinarians and extension service providers and continue researching and providing public veterinary and extension services.
- Facilitate collaboration between NARI and the University of the Gambia and other stakeholders in the livestock sector to ensure that training at the faculty of science produces graduates with needed skills.
- Promote adaptive research on exotic breeds and milk improvement along the value chain.
- Increase the number of farmers that receive intensive and continuous cattle improvement training (training, exchange visits, farmer advisory services and practical demonstrations) to 50% by the end of the LMP. Currently, very few farmers get intensive and continuous cattle improvement training.

3.7.7.5 Marketing and processing improvement interventions:

- Improve the meat marketing infrastructure in 10 primary markets (Sare Ngai, Sare Bojo, Brikamaba, Wasu, Jareng, Samitenda, Farafeni, Bureng, Kerr Pateh, Ndugukebbah, Fass Njaga Choi and Panchang) and two terminal markets (Abuko and Brikama) by 2027. This improvement includes fencing of holding grounds and provision of watering facilities, sheds, offices, toilets, loading ramps, slaughter slabs, meat stalls, cold storage facilities and weighing scales.
- Strengthen the newly established livestock market information system and sensitize users about it.
- Subsidize milk and meat producer cooperatives to introduce specialized vehicles for transporting live animals and animal products.
- Provide capacity-building training for market management committees.

- Support the establishment of marketing cooperatives within five years⁴.
- Support cooperatives to improve the collection, transportation and processing of livestock products.
- Encourage and subsidize private actors to enable them to establish small-scale milk processing plants. It is targeted that five small-scale milk processing plants will be established by 2027.
- Encourage private sector investors to establish two modern abattoirs within five years.
- Support commercial dairy farms to increase the number of commercial dairy farms in the Gambia. It is targeted that an additional about 40 commercial dairy farms (with a current farm size of about 65 animals) will be established by 2027.
- Modernize the 10 existing slaughterhouses by 2027.
- Establish a tannery by 2027.
- Encourage online marketing to facilitate the marketing of livestock inputs, services and products. Online marketing will require improved internet networking, faster internet and reduced cost of data bundles.

3.8 Investment budget

The budget for the planned interventions in the cattle (beef and dairy) sector during the first five years of the LMP is USD 36.97 million (Table 2)⁵. Overall, investments in “Education, Research and Extension services” together with “animal health” account for the highest share of the total budget (39% and 33%, respectively) (Table 2). The estimated investment cost coming from public funds amounts to USD 31.4 million (about 85% of the total budget). The corresponding amount from the private sector is USD 5.5 million (about 15% of the total budget). For feed interventions, the private sector will shoulder 55% of the investment cost, whereas, for genetic improvement and marketing investments, 89% to 96% will be borne by the public sector, respectively (Figure 4).

Table 2: Dairy and beef roadmap investment cost by intervention areas

	Total (USD)	Private (USD)	Public (USD)	Share of investments by category
Feed and feeding	4,371,880	2,394,690	1,977,190	12%
Animal Health	12,366,819	536,819	11,830,000	33%
Genetic improvement	3,279,971	356,486	2,923,486	9%
Education, research and extension services	14,509,051	2,000,000	12,509,051	39%
Marketing investments	2,443,088	250,000	2,193,088	7%
Total	36,970,809	5,537,994	31,432,815	100%

As shown in Annex Table 3, the level of projected investments in the first year accounts for the largest share (37%) of the total five-year costs.

Interventions accounting for the highest level of investments include:

- Feeds and feeding
 - Developing low-lying areas (manmade and natural depressions) for water harvesting (USD 1,600,000).
 - Provision of guarantee funds to banks who offer loans for the establishment and running of commercial dairy farms (USD 1,050,000).

4. The establishment of marketing cooperatives within five years also applies for each of the different commodities (small ruminants, layers, broilers and free-range chickens). However, budgetary allocation is captured in the cattle roadmap budget.

5. Detailed budget for the cattle roadmap is in Annexe Table 3.

- Animal Health
 - Strengthening of the existing six regional veterinary stations through infrastructure improvement and provision of equipment (USD 3,840,000).
 - Infrastructure improvement, provision of equipment and hiring of personnel for the open positions in the existing 53 veterinary sub-stations (USD 2,650,000).
 - Establishing 10 new veterinary sub-stations (USD 1,000,000).
 - Capacity improvement of the existing six Regional Veterinary Laboratories through infrastructure improvement, provision of equipment, staffing and staff capacity development (USD 3,840,000).
- Education, research and extension services
 - Provision of financial support, necessary equipment and training opportunities to the staff of WALIC to expand its local cattle improvement program and other research (USD 2,921,751).
 - Strengthening of public livestock extension service delivery in terms of mobility (USD 1,910,000).
 - Provision of incentives, career progression opportunities and scholarships to the staff at NARI, WALIC and DLS to improve their retention (USD 2,500,000).
 - Upgrading of the four training centres and four demonstration units for full capacity utilization (USD 2,012,300).
 - Promoting private veterinary and extension service providers by subsidizing veterinary and livestock experts to establish veterinary pharmacies and input shops that can provide farmers with veterinary and extension services (USD 2,200,000).
 - Supporting the emergence of private livestock extension service providers by subsidizing the private extension service providers (USD 1,800,000).

Figure 4: Dairy and beef investments by intervention areas and source of funding.

3.9 Impacts of interventions

3.9.1 Return on investment (ROI) over 20 years

To evaluate how well an investment will perform compared to a no-investment scenario, an ROI was performed, which is calculated by dividing the net income from the investment by the total cost of the investment, without considering other effects like GDP, among others. The ROI was calculated using the internal rate of return (IRR), which considers the time value of money. The IRR identifies the rate of discount, which makes the present value of the sum of annual nominal cash inflows equal to the initial net cash outlay for the investment. The ROI analysis conducted over 20 years⁶ under the WI scenario for the dairy sector indicates a higher IRR observed in the Western production zone for both N'Dama (42%) and Zebu/Gobra (31%) when milk prices are GMD 60 for the Western compared to the other zones (Figure 5). On the other hand, the IRR observed for GMD 30 milk prices for N'Dama and Zebu/Gobra are 20% and 18%, respectively. The N'Dama breed is projected to have a higher IRR across all production zones than the Zebu/Gobra breed. The Central zone is projected to record the least IRR of 18% and 16% for the N'Dama and Zebu/Gobra cattle farm systems, respectively, compared to 19% and 18% for Eastern for the two breeds, respectively. This illustrates a much more financially viable investment in dairy improvement interventions in the N'Dama breeds compared to the Zebu/Gobra breeds across all production zones. This result is also corroborated by the positive net present value recorded for all the production zones and species but higher for N'Dama breeds than Zebu/Gobra breeds, indicating that the projected earnings generated by investment in dairy improvement programs discounted for their present value will exceed the anticipated costs of the investments; hence, it is more financially viable to invest in such interventions for N'Dama breeds than Zebu/Gobra breeds.

Figure 5: Internal rate of return (IRR) for cattle under a 20-year investment plan.

3.9.2 Projected income increases per animal in 15 years

The income per animal for both N'Dama and Zebu/Gobra breeds of cattle in the Western production zone is projected to be twice that of the Central and Eastern production zones. In the Western production zone, income for Zebu/Gobra cattle owners is projected to increase to GMD 13,179 under the WI scenario compared to GMD 11,787 under the BAU scenario during 15 years (Figure 6). The income per animal will be slightly lower

6. IRR analysis was conducted for a 20-year period under the WI scenario because of the long time it takes for most livestock improvement investments to generate full benefits due to the slow adoption rate.

for N'Dama cattle under the WI scenario (GMD 12,497) compared to the BAU scenario (GMD 7,574) under the same 15-year scenario. The reason for the high income per animal in the Western zone is due to the production system practised where animals, particularly the Zebu/Gobra breeds, are placed under semi-intensive and intensive farm systems and supplemented with feed and high disease control given more priority compared to the other production zones where the extensive system is highly practised with fewer animal supplements and attention on the animals.

Figure 6: Cattle income per animal under business as usual (BAU) and with investment (WI) scenarios in 15 years (2023–2037).

Source: LS IPT⁷ results

3.9.3 Meat and milk production

3.9.3.1 Meat production

Total beef production under an investment scenario where cattle improvement interventions are implemented is projected to increase by 38.8%, from 4,073 tonnes in the base year to 5,655 tonnes in 2027 (Table 3). Most production is projected to come from the N'Dama breed, which would contribute 97% of the total beef produced in 2027. On the other hand, beef from commercial dairy, which is very small, is projected to increase from 10 tonnes in 2022 to 94 tonnes in 2027, an 854% increase over the five years (Table 3).

The Eastern production zone is projected to contribute the most beef, increasing from 2,275 tonnes to 3,094 tonnes, representing 36% over the five years. Beef production in the Eastern zone is more than the combined production from the Western and Central zones. On the other hand, the projections show that the Western production zone will contribute the least beef, though it will have a larger percentage increase of 44%, increasing from 528 to 760 tonnes over the five years under the WI scenario.

7. LS IPT – Livestock Sector Investment and Policy Toolkit results for The Gambia

Table 3: Cattle meat production projected for five years under the investment scenario

Production zone	Sub-system	Beef production (tonnes)						% Change
		Base year 2022	2023	2024	2025	2026	2027	
Western	N'Dama	516	556	598	644	694	747	44.8%
	Zebu/Gobra	12	12	12	13	13	13	10.7%
	Total	528	568	611	657	707	760	44.0%

Grand total production		4,073	4,350	4,645	4,960	5,296	5,655	38.8%

3.9.3.2 Milk production

Like beef, milk production in the Gambia is projected to increase markedly by 2027, rising 116.7% from a projected 20.2 million litres in 2022 to 43.7 million litres in 2027 (Table 4). Most of the milk production in 2027 is projected to come from N'Dama breeds, with an estimated 36.6 million litres, representing 83.6% of the total milk production in the Gambia. Across all three production zones, milk production from the N'Dama breed is projected to have the largest percentage increase from 2022 to 2027 compared to the Zebu/Gobra breed. Commercial dairy farms are projected to produce only 6.3 million litres, which is 14% of the total milk production in the Gambia, though it is projected to increase by 2,469.9% over the period. The Eastern production zone is projected to produce most of the milk in the Gambia, with an estimated 47% of the total milk production in 2027 compared to 27% from the Central and 11% from the Western zones.

Table 4: Cattle milk production projected for five years under the investment scenario

Production zone	Sub-system	Milk production (thousand litres)						% Change
		Base year 2022	2023	2024	2025	2026	2027

3.9.3.4 Manure and draught power

Increases in manure and draught power from cattle are projected by 2027. Manure production is projected to increase from 160,106 tonnes in 2022 to 174,050 tonnes in 2027, an 11% increase (Table 5). On the other hand, the projected increase in draught power over the five years is 12.2%, from a base year total of 5.6 million days to 6.1 million days in 2027.

Table 5: Cattle meat, milk, manure and draught power production projected for five years under the investment scenario

Products	Sub-system	Base year 2022	2023	2024	2025	2026	2027	% Change
Beef (tonnes)	N'Dama	3,993	4,255	4,533	4,830	5,147	5,484	37.3%
	Zebu/Gobra	70	72	73	75	76	78	11.3%
	Commercial	10	15	24	38	60	94	854.6%
	Total	4,073	4,350	4,645	4,960	5,296	5,655	38.8%
Milk (thousand litres)	N'Dama	19,232	21,868	24,867	28,276	32,153	36,561	90.1%
	Zebu/Gobra	695	721	748	777	806	836	20.4%
	Commercial	246	471	902	1,727	3,305	6,326	2,469.9%
	Total	20,173	23,548	27,488	32,088	37,456	43,724	116.7%
Manure (tonnes)		160,106	160,106	163,484	166,933	170,454	174,050	11.0%
Draught power (thousand days)		5,603	5,603	5,733	5,866	6,002	6,141	12.2%

3.9.3.5 Gross domestic product (GDP) contribution

The contribution of cattle products (beef, milk, manure and draught power) to GDP in the Gambia is projected to increase by 4%, from GMD 4.2 billion in 2022 to GMD 4.3 billion in 2027 (Table 6). While there is a projected increase in beef, milk and manure contribution between 2022 and 2027, the value of draught power is projected to witness a decline of 21% within the same period. The value of beef is projected to increase from GMD 689 million to GMD 723 million, a 5% increase compared to the GMD 379 million increase in the value of milk from commercial production systems. The value of draught power is projected to be 53% of cattle's overall contribution to GDP, although it will decrease from GMD 2.9 billion to GMD 2.3 billion by 2027.

Table 6: Total cattle GDP contribution projected for five years under the investment scenario (in million GMD)

Products		Base year 2022	2023	2024	2025	2026	2027	% Change
Beef	N'Dama	677	678	680	682	684	686	1.4%
	Zebu/Gobra	12	12	12	12	13	13	5.1%
	Commercial	0	0	1	3	9	25	13,707.5%
	Total	689	696	702	709	716	723	5.0%
Milk	N'Dama	527	585	650	721	800	889	68.6%
	Zebu/Gobra	17	17	18	18	19	19	14.3%
	Commercial	1	3	11	35	115	380	38,902.9%

3.10 Complementary conditions required for the success of investments

- The extension system needs to advance toward providing consistent and intensive extension services to farmers.
- Conducive policies, regulations and incentive regimes for private investment in extension, feed, breeding, animal health services, commercial dairy and beef and milk processing and marketing.
- Favourable weather conditions.
- Donors and development partners to follow through on their commitment.
- Collection and processing of milk in the country are improved.
- Good governance and monitoring and evaluation framework for the impact of interventions.

3.11 Gender and social inclusion implications for cattle value chain development

Most cattle in the Gambia are owned by men (84.6%). However, there are marked differences in ownership patterns at the regional level, with women owning about 25% of all cattle in the Lower River Region (National Livestock Census 2016). Women own cows, received as dowry, and these cows are kept and managed throughout by male herders. Herders use milk produced by those cows as payment for herding wages. Despite the ownership of cattle being dominated by men, generally, milk (and milk products) produced in the traditional extensive system is mostly managed by women who are responsible for its collection, storage, processing and utilization at the household level (for domestic consumption) and sale in the open market.

When intervention measures are implemented, there will be increases in cattle population and meat and milk production. The involvement of women farmers in milk production, both commercially and at smallholder levels, will increase for N'Dama and Zebu/Gobra. The availability of affordable meat will greatly benefit women and households in improving maternal and childhood nutrition. With the increased access to animal-source foods (more meat and protein and other nutrients and micro-nutrients), more women's, children's and other vulnerable groups' nutritional, economic and social status are expected to be improved. Moreover, an increased number of commercial dairy animals translates to increased availability of milk. Driven by the normative ideas of masculinity and femininity associated with the interactions with cattle in the Gambia, men are normally responsible for milking cattle. At the same time, women are responsible for selling milk and milk products from the farm gate to the consumers. Manure is another economically viable product to explore. Anecdotal evidence from farmers (informants from discussions amongst workshop participants) points to the likelihood of sales from manure being more profitable than sales of livestock. Moreover, farmers are already cognizant of the value of using manure in their vegetable gardens and the profits from its sales.

3.12 Conclusions

The cattle sector, comprising both meat and dairy, plays a significant role in the livelihood of producers in the Gambia as well as in the economic development of the country. The sector, which employs a significant number of people, is a vital source of GDP, income and food for many individuals and households, probably contributing significantly to poverty reduction and nutrition security in the country. With growing urbanization and an increase in population and income, it is projected that the demand for meat and dairy products will increase. Therefore, producers in the cattle value chain can take advantage of this growing demand to increase their incomes and well-being. It also presents several opportunities for marginalized people in the value chain, particularly women, to increase their participation in the value chain through engaging in more productive and income-generating activities

instead of being confined to the lower-income-generating roles they currently play in most livestock value chains, including cattle. The government has intervened in various ways through many projects and programs, all targeted at helping farmers take advantage of the many opportunities the sector brings. However, this has been inadequate over the years. Challenges such as disease outbreaks, shortage of feed and fodder, fewer marketing opportunities and low penetration rate, among others, still limit the growth of the cattle value chain in the Gambia. These, coupled with other socioeconomic challenges, still make it difficult for the sector to see the needed boost to meet the rising demand for meat and milk from cattle.

To improve the cattle value chain to provide the needed economic development to farmers and the economy, there is a need to focus on addressing the challenges affecting the value chain in the areas of feed, animal health, marketing and research, among others, in all production zones and across all breeds, indigenous and crossbred. Notably, the proposed interventions in feed improvement and animal health need to be specific to each production zone to benefit all value chain actors. Focusing on genetic improvement and promoting animal breeding activities, investing in research and extension, delivering animal health services, and processing and marketing are essential in bringing the needed benefits.

The Gambia's economy will see much-needed growth when additional investments are made in addressing the challenges identified above in the cattle value chain. These will increase the population of both crossbred and indigenous cattle by 11% between 2022 and 2027, positively impacting both meat and milk production by 38.8% and 116.7%, respectively. Not only will this help reduce the difference between domestic meat and milk consumption and production, but it will also increase livestock GDP by 4% and improve farmers' incomes.

4 Small ruminant value chain roadmap (2023–2027)

4.1 A summary of results and conclusions from the 15-year livestock sector strategy (LSS)

Rearing of small ruminants is widespread in all regions under extensive and subsistence-oriented production systems. Intensive small ruminant and poultry production systems have recently evolved and are proliferating in the peri-urban areas and around the growth centres. The challenges facing small ruminant production in the Gambia are similar to the challenges in cattle production: poor feeding, low productivity for local breeds of goats, diseases and marketing challenges. Thus, recommendations similar to those for cattle address the challenges of poor feeding in small ruminants. Likewise, for animal genetics, recommendations include efforts to reverse the erosion of indigenous goat genetic resources together with conservation, utilization and development of West African Dwarf goats and Djallonke sheep (the indigenous breed) through broadening, strengthening and sustaining the breeding program being implemented by DLS and WALIC; bio-morphometric and molecular characterization of the West African Dwarf goats and Djallonke sheep; as well as their phenotypic characterization. In animal health, implementation of the National Strategy for the Control and Eradication of PPR in the Gambia was recommended in addition to the improvements in the delivery of general animal health services, as noted above for cattle. To address the challenges in marketing, the development of improved market infrastructure for small ruminants, together with the construction of a modern abattoir and meat processing plants in the Western Region, was recommended. In the Central and Eastern regions, it was recommended that women engaged in small ruminant production should be supported and encouraged to form producer associations or marketing cooperative societies and to work closely with the National Livestock Owners Association. In addition, a program for building modern slaughterhouses and slabs in rural areas should be initiated.

The foresight analysis indicated that:

- The production of goat meat is projected to increase from 1,125 tonnes to 1,483 and 3,581 tonnes under BAU and WI scenarios, respectively, representing growth of 31.8% and 218.3% by 2027. Likewise, sheep meat production is projected to increase from 504 tonnes to 640 and 1,748 tonnes under BAU and WI scenarios, respectively, representing 26.9% and 246.7% growth by 2027.
- Without any intervention (BAU scenario), the Gambia may not be able to meet the future domestic demand for meat from sheep and goats from domestic production. Production in 2037/38 under the BAU scenario is only projected to be 2,150 tonnes, far below the projected demand of 4,683 tonnes.
- With interventions, the Gambia may meet and exceed the projected domestic demand for sheep and goat meat in 2037/38, with a projected production of 5,329 tonnes.

4.2 Five-year vision for the small ruminant value chain

The five-year vision for the small ruminant value chain improvement interventions is to increase the production of goat meat and mutton to address the projected gap between domestic consumption and production. Goat meat and mutton production in the Gambia is projected to grow by 54 and 59%, respectively, in the coming five years to 2027. The contributions of goat meat and mutton to GDP are projected to increase by GMD 46 million and GMD 32 million from 2023 to 2027 – equivalent to 18% and 19% increases, respectively.

4.3 Description of small ruminant production systems

Small ruminants play an important role in the livelihoods of rural populations in the Gambia. They are raised to generate income and meet the nutritional requirements of rural families. They are also sold to meet family needs and fulfil the sociocultural obligations of the owners. Small ruminants are easier to sell than larger animals and serve as ready sources of income for purchasing food during lean periods. The precarious and erratic nature of rainfall, coupled with the concomitant crop failures observed in recent years, is forcing farmers to rely more on small ruminants to meet the food and other requirements of their families. Furthermore, given the prolific nature and short generation interval of small ruminants, they likely contribute significantly to the enhancement of food security and poverty alleviation in rural communities. For these reasons, the ownership of sheep and goats is widespread in all regions.

The National Livestock Census (2016) enumerated that in the Gambia there are 172,662 sheep and 328,336 goats. With 60,927 sheep, the Upper River Region has 35.9% of the national sheep flock. Similarly, with a population of 85,447 or 26.2% of the caprine population, the Upper River Region has the highest population of goats when compared to all other regions in the country.

The productivity of small ruminants under the traditional system is low owing to inadequate nutrition, poor management practices and high mortality rates due to frequent disease outbreaks. Compared to cattle, more sheep and goats are sold each year, with off-rates recorded at 23.6% and 25%, respectively. The yearly production of sheep and goat meat is estimated at 550 and 1,028 tonnes, representing 0.3 kg and 0.6 kg per inhabitant, respectively (Bahta et al. 2022).

The production systems are primarily extensive and traditional, and productivity is generally low. Domestic demand for sheep and mutton is larger than the domestic supply. As a result, the country relies heavily on imports. The cited low productivity is due to several challenges requiring appropriate policies and strategies to ensure the subsector's growth. Addressing these challenges will improve the subsector's performance with potential contributions to food and nutrition security and employment creation.

Although extensive systems predominate, intensive production systems (using zero grazing) produce fattened rams targeting the "Tobaski" (the local name for the Muslim feast of Eid ul Adha) market are becoming more common. Commercial sheep fattening schemes targeting this niche market have mushroomed countrywide. In the Western production zone, specialized commercial farms using breeds such as Ladoum, Troibirr, Puelpuel and crosses of Djallonke sheep and other exotic breeds are now very important.

At the National Livestock Show and Tobaski Ram Sale in 2017, a total of 33,090 Tobaski rams were presented for sale to the public at the Livestock Show Ground in Abuko (Loum 2019). The rams presented for sale originated from regions within the country as well as Senegal, Mali and Mauritania.

In 2019, 57 ram fattening schemes, mostly owned by women's groups and individuals, were established with 1,310 rams. More than 900 rams were sold, and GMD 4,443,116 was generated from the sales of the rams.

4.4 Opportunities, challenges and strategies

Rapid urbanization and population growth have resulted in an increased demand for red meat that is partly met through importing slaughter stock from neighbouring countries. However, in the long term, the need to sustainably satisfy this demand (and to ease pressures on natural resources imposed by animals) will require the adoption of intensification. Successful approaches to intensifying livestock production have already been tried and tested in the Gambia. They include ram fattening schemes and the establishment of compost pens for cattle for improved meat, milk and manure production and draught power. Thus, these activities and the technical, financial and institutional support needed for their widespread dissemination constitute the core of the subsector policy strand for the government's 2017–2026 Agriculture and Natural Resource Policy (ANRP).

Meeting the demand for red meat will come through increased productivity of the livestock sector rather than increased numbers of animals. It follows that priorities include genetic improvement of the indigenous breeds of cattle and small ruminants, improvement of management practices, and the delivery of veterinary services to increase productivity and efficiency of production.

The challenges for the red meat value chain are not dissimilar to the constraints facing the dairy sector and thus are not repeated here. To address these challenges⁸, development strategies and investments are needed that target production regions and species that have the potential to generate significant economic and social gains without causing irreparable damage to the environment and natural resources.

4.5 Investment scenarios analysed

Consistent with analyses discussed above for cattle, the investment analysis examines two scenarios (BAU and WI) and their implications for goat and sheep productivity and incomes; goat and sheep meat, milk and skin production; and the contributions of the goat and sheep subsector to GDP. This allows comparison of alternatives for the livestock planning unit and decision-makers – farmers, new goat and sheep keepers, government, private investors and development partners (donors) – in the medium-term or five-year roadmap for the Gambia.

4.6 Overall livestock master plan targets under the intervention scenario

Under the WI scenario, the goat population in the Gambia is projected to increase by 27.6% within five years, from 367,126 in the LMP base year (2022) to 468,556 in 2027 (Table 7). Among the three production zones, the population of goats is projected to increase by the same (27.6%) within five years. In terms of animal numbers, more goats are produced in the Eastern production zone, followed by the Central and Western. This is due to the greater abundance of feed, making the Eastern production zone an ideal location for small ruminant production. The population of goats is projected at 243,764, 123,824 and 100,969 for Eastern, Central and Western production zones, respectively. The women-owned sub-system dominates goat production for all three production zones compared to the small (ownership of 1–10 head) sub-system. Both small and women-owned sub-systems are projected to increase by 27.6% between 2022 and 2027 under all production zones (Table 7).

The total sheep population is projected to increase by 28% within five years, increasing from 191,540 in 2022 to 244,459 in 2027 under an investment scenario (Table 8). Most of the goat population is expected to be in the Eastern production zone, and the least in the Western production zone. The population of sheep in the Eastern production zone is projected to be twice the population in both the Western and Central zones combined in 2027. Among the three breeding systems of sheep production in the Gambia, the women-owned (Djallonke)

8. See Bahta et al. (2022).

dominates and is projected to outweigh the Djallonke and Sahelian under all production systems. In 2027, the sheep population in the women-owned systems is projected at 78,044, 47,604 and 40,572 for Eastern, Central and Western production zones, respectively (Table 8).

Table 7: Goat population targeted for five years under the scenario with additional investment (WI)

Production zone	Sub-system	Goat population, WI scenario						% change
		Base year 2022	2023	2024	2025	2026	2027

Source: The Gambia LMP analysis

Total goat meat production is projected to increase from 1,125 tonnes in the base year to 1,736 tonnes in 2027, a 54% increase within the period under an intervention scenario (Table 9). Most of the goat meat in 2027 is projected to come from the Eastern production zone, followed by the Central production zone, and least in the Western production zone. Goat meat from the Eastern production zone is more than the combined production from the other two zones, though its percentage change in production (51%) will be less than in the Central (58%) and Western (60%) zones. In all three production zones, the contribution of women-owned systems to total goat meat production is projected to be more than small systems, though by a small quantity. For example, in the Eastern production zone, goat meat from the women-owned system is projected to be 469 tonnes compared to 450 tonnes from small systems in 2027 (Table 9).

Table 9: Goat meat production targeted for five years under the scenario with additional investment (WI)

Production zone	Breed/sub-system	Goat meat production (tonnes)						% Change
		Base year 2022	2023	2024	2025	2026	2027	
Western	Small (1–10)	113	113	113	113	113	181	60%
	Women Owned	118	118	118	118	118	189	60%
	Total	231	231	231	231	231	370	60%
Central	Small (1–10)	139	139	139	139	139	219	58%

Under the intervention scenario, total meat from sheep is projected to increase by 59%, from a base year production of 504 tonnes to 803 tonnes in 2027 (Table 10). Like goat meat production, most of the sheep meat is projected to come from the Eastern production zone, followed by the Central and least in the Western production zone. Total sheep meat from the Eastern zone is projected to be almost twice as much as the total contribution from the other two production zones combined. In all three sub-systems, the women-owned system is projected to contribute more sheep meat than the Djallonke and the Sahelian. Though the Central production zone is projected to produce the least sheep meat, its percentage change in meat production is projected to be higher (94%) compared to the Western (60%) and Eastern (51%) zones within the period (Table 10).

Table 10: Mutton production targeted for five years under the scenario with additional investment (WI)

Production zone	Breed/sub-system	Mutton production (tonnes)						% Change
		Base year 2022	2023	2024	2025	2026	2027

4.7 Small ruminant improvement interventions

4.7.1 Feed improvement interventions:

The cattle meat and dairy feed improvement interventions listed under the cattle meat and milk improvement section also apply to sheep and goats. However, the feed interventions critical to sheep and goats are:

- Sensitize farmers to grow fodders and fodder trees as fences and hedges to supplement sheep and goats and enhance feed availability during the dry season.
- Promote collecting, preserving and enhancing crop residues, including appropriate farmer training.
- Encourage commercial sheep and goat farms to establish intensive feed gardens using fodder legumes such as *Cajanus cajan*, *Leucaena* and *Moringa* species, and other palatable species in the forested areas.
- Encourage commercial sheep and goat farms that practice zero-grazing schemes by providing subsidies.
- Improve availability of and access to agricultural by-products (cakes, bran, etc.) and raise awareness of the importance of the by-products of cottage edible oil industries for the livestock sector.
- Train farmers on the construction of small houses for small ruminants. Farmers can construct these houses using locally available materials. Providing farmers with manuals on constructing these small sheep and goat houses can speed up adoption.

4.7.2 Health improvement interventions:

The cattle health service improvement interventions listed under the cattle meat and milk improvement section also apply to sheep and goats. However, the health improvement interventions specific to the sheep and goats are:

- Conduct routine mass vaccinations against PPR and pasteurellosis. It is targeted to raise the percentage of sheep and goats vaccinated to 80% by the end of the LMP period in 2027.
- Conduct routine deworming campaigns. It is targeted to raise the percentage of sheep and goats covered under the routine deworming campaign to 60% by the end of the LMP period in 2027.

4.7.3 Genetic improvement interventions:

- Develop a breeding policy for sheep and goats in the coming three years.
- Provide matching grants of USD 2,000 as seed capital for establishing private breeding farms, which will develop new and improve existing sheep and goat breeds and perform multiplication and distribution of the breeds.
- Encourage commercial sheep and goat farms that practice zero-grazing schemes by providing subsidies.
- Start one community-based local sheep and goat breed improvement scheme.
- Sensitize small ruminant owners about the culling of unproductive animals and the selection and retaining of good breeding rams and bucks in the flock.
- Strengthen the existing local breed improvement research being carried out by WALIC by providing adequate resources for purchasing additional rams and ewes, training livestock technicians, Geneticists and equipment.
- Strengthen livestock farmers' associations such as GILMA.

4.7.4 Research and extension improvement interventions:

The cattle research and extension service improvement interventions listed under the cattle meat and milk improvement section also cater to sheep and goats. Additional research and extension improvement interventions specific to sheep and goats are:

- Coordinate and facilitate financial support, training opportunities and the necessary equipment for WALIC to expand its local sheep and goat improvement program.
- Provide farmers with intensive and consistent training on improved sheep and goat management practices. The proportion of farmers getting intensive and consistent training will reach 50% by the end of the LMP period in 2027.

4.7.5 Marketing and processing improvement interventions:

- Construct adequate marketing facilities at the level of the weekly markets at Sare Ngai, Sare Bojo, Brikamaba, Wasu, Jareng, Samitenda, Farafeni, Bureng, Kerr Pateh, Ndugukebbbeh, Fass Njaga Choi and Panchang, with fencing for livestock holding grounds, watering facilities, sheds, toilets and loading rams.
- Form small ruminant owner's cooperatives. The cooperatives can be provided with weighing scales to facilitate the marketing of sheep and goats.
- Improve the infrastructure at the veterinary stations in Yorro Beri Kunda, Sololo and Basse.
- Construct two more terminal markets in the coming five years.
- Promote the use of appropriate transportation facilities for animals from primary to terminal markets and enforce the use of refrigerated transport facilities for meat transportation.
- Perform a feasibility study within two years to construct a tannery and assess the potential market for processed hides and skins.

4.8 Investment budget

The total investment in the small ruminant value chain will be USD 1.5 million (Table 11). Feeds and feeding account for the highest proportions of the investment, followed by marketing and genetic improvement. The private sector and other sources will account for 39% of the investment, while the public sector will account for 61% (Figure 7). While 24% of the investments are planned for the first year, under 20% are planned in each of the remaining four years, except for marketing investments, where the private sector will shoulder most of the cost (71%). The public sector will bear the highest share of the costs for other categories of interventions as well (67% to 100%) (Figure 7). Interventions that account for the biggest share of the budget include the construction of five slaughterhouses and five modern meat stalls and the provision of a 40% subsidy on the cost of the establishment of commercial sheep and goat farms that practice zero grazing.

Table 11: Small ruminants roadmap investment cost by intervention areas

	Total (USD)	Private (USD)	Public (USD)	Share of investments by category
Feed and feeding	625,000	205,000	420,000	40%
Animal Health	135,616	0	135,616	9%
Genetic improvement	335,345	80,000	255,345	22%
Education, research and extension services	0	0	0	0%
Marketing investments	454,385	324,385	130,000	29%
Total	1,550,346	609,385	940,961	100%

Figure 7: Small ruminant investment proportion by intervention areas and source of funding.

4.9 Impacts of interventions

4.9.1 Return on investment (ROI) over 20 years

An ROI analysis for the small ruminant sector was conducted over 20 years due to the long-term growth of livestock investments. Since there is no one-size-fits-all duration in which impacts will be realized from livestock interventions, and no synchronization of the listed interventions, a longer term of 20 years is chosen. The livestock sector in the Gambia is still evolving, and it is believed that after this time, the necessary resources will have been gathered for the implementation of the interventions and sufficient adoption by farmers for the intended benefits to be realized. The three production zones are projected to achieve an IRR of 19–22% under the WI scenario (Figure 8, top). The Central zone is projected to achieve a higher IRR because it experiences higher current mortalities compared to the other zones. Hence, the adoption of vaccination will result in a larger reduction in mortality rates.

Similarly, a higher IRR is observed among both Djallonke and Sahelian sheep farmers in the Central zone compared to the Western and Eastern zones. The Central zone is projected to record an IRR of 32% and 28% for the Djallonke and Sahelian systems, respectively (Figure 8, bottom). The Eastern zone will, however, record the lowest IRR of 23% for the Djallonke system and 17% for the Sahelian system, compared to the Western zone's 28% for the Djallonke system and 18% for the Sahelian system under a 20-year investment period. Though the net present values for all production zones are positive, the Central production zone is projected to have the biggest net present value for all breeds, showing a larger return on investing in sheep production in that production zone compared to the others.

The projections suggest that among investments in small ruminant interventions, sheep will be the most financially viable, with larger rates of return for the Central zone and for Djallonke sheep.

Figure 8: Internal rate of return (IRR) for goat and sheep investments over 20 years.

4.9.2 Projected increases in income per animal in 15 years

Figure 9 shows the projected income per goat after 15 years under both BAU and WI scenarios. The Western production zone is projected to record the highest income per animal, followed by the Eastern production zone and lastly by the Central production zone. The income per animal for women-owned and small farms with fewer than 10 goats is GMD 937 under the WI scenario and GMD 822 under the BAU scenario. Likewise, the income per animal for both women-owned and small farms with fewer than 10 goats is GMD 814 under the WI scenario and GMD 728 under the BAU scenario in the Eastern production zone. In the Central production zone, income per animal is projected at GMD 786 under the WI scenario, which is GMD 151 less than that of the Western production zone and GMD 28 less than the income per animal in the Eastern production zone (Figure 9).

Figure 9: Projected annual income per goat under the business as usual (BAU) and with intervention (WI) scenarios in 15 years (by 2037).

Source: LS IPT results

The annual income per sheep under both BAU and WI scenarios is projected to be higher than for goats for the three production zones. The Central production zone will record the highest annual income per sheep for women-owned and Djallonke systems under the WI scenario compared to the Western zone's women-owned and Djallonke systems given the same investment scenario (Figure 10). Interestingly, the income per sheep in the WI scenario is more than twice that for women-owned and Djallonke systems in the BAU scenario. Investment in interventions will result in a slight increase in income per sheep under a Sahelian system in the Western production zone (Figure 10).

Figure 10: Projected annual income per sheep under the business as usual (BAU) and with intervention (WI) scenarios in 15 years (by 2037).

Source: LS IPT results

4.9.3 Meat Production

Goat and sheep meat in Gambia is projected to increase substantially when the proposed interventions outlined in the previous sections are implemented. Total meat production from these two species is projected to increase from 1,629 tonnes in the base year (2022) to 2,539 tonnes in 2027, a 56% increase (Table 12). The Eastern zone is projected to produce more goat and sheep meat (958 tonnes in 2022 to 1,445 tonnes in 2027) than the Central and Western zones. The analysis projects an increase in goat meat production from 1,125 tonnes in 2022 to 1,736 tonnes in 2027, a 54% increase. In the Eastern production zone, goat meat is projected to experience a 51% increase from 610 tonnes to 919 tonnes, although the increase will be lower than in other zones.

Sheep meat is projected to increase from 504 tonnes in 2022 to 803 tonnes in 2027, a 59% increase. Production in the Eastern zone is projected to increase by 51% from 348 tonnes to 526 tonnes. In contrast, sheep meat production in the Central zone is projected to experience a larger increase (94%) compared to the Western zone (Table 12).

Total manure production from sheep and goats is projected to increase from 52,475 thousand tonnes to 67,653 thousand tonnes between 2022 and 2027. Most of the manure in 2027 will come from goats (50,619 thousand tonnes) – about three times the amount from sheep.

Table 12: Change in goat meat, mutton and other products under the with intervention (WI) scenario

Products	Production zone	Production						% change (base year to 2027)		
		Base year 2022			2027					
		Goats	Sheep	Total	Goats	Sheep	Total	Goats	Sheep	Total
Meat (tonnes)	Western	231	81	312	370	131	501	60%	60%	60%
	Central	284	75	359	447	146	593	58%	94%	65%
	Eastern	610	348	958	919	526	1,445	51%	51%	51%
	Total	1,125	504	1,629	1,736	803	2,539	54%	59%	56%
Manure (thousand tonnes)	The Gambia	39,276	13,199	52,475	50,619	17,035	67,653	29%	29%	29%

Source: The Gambia LMP analysis

4.9.4 Contributions to gross domestic product (GDP)

Investments will increase the contribution of goats and sheep to GDP from GMD 429 million in 2022 to GMD 507 million in 2027 (Table 13). Most of the contribution in 2027 will come from goat meat, which is 60% larger than the contribution from sheep. In the Eastern production zone, which produces more goat and sheep meat, the overall contribution is projected to increase from GMD 255 million to GMD 286 million between 2022 and 2027. The Central production zone is projected to have the largest increase in GDP contribution, followed by the Western production zone, although the absolute magnitude of the contribution is far less than for the Eastern production zone.

The contribution to GDP from manure from both goats and sheep is projected to increase by 31% from 2022 to 2027. Contribution from manure from both goats and sheep is projected to increase by 31% respectively between 2022 and 2027.

Table 13: Change in contribution to GDP of goat and sheep products under the with intervention (WI) scenario

Product	Production zone	GDP (million GMD)						% Change (Base year to 2027)		
		Base year 2022			2027					
		Goats	Sheep	Total	Goats	Sheep	Total	Goats	Sheep	Total

4.10 Complementary conditions required for the success of investments

- The Livestock Department and the Gambia Forest Department, which are under the Ministry of Agriculture of the Gambia, need to have synchronized plans and targets to ensure the sustainable use of communal grazing lands and forests.
- Vaccination of sheep and goats for important diseases needs to be consistent and timely in its pursuit.
- Schemes that can support emerging commercial sheep and goat farms need to be developed.

4.11 Gender and social inclusion implications for small ruminant value chain development

Women play a major role in small ruminant (sheep and goats) production, mainly as smallholders. The overwhelming majority of farmers involved in goat production are women and youth, mainly rearing under the extensive production system, but also in small-scale intensive and semi-intensive production systems in some cases. Women own the overwhelming majority of goats in the country – 68%. Most farmers keep sheep and goats under the traditional mixed farming systems where local breeds move in flocks and graze on grasses and shrubs in the locality. In contrast, a minority of farmers practice a market-oriented system (involving feedlots for sheep fattening). According to DLS, 2020, the DLS Activity Report for 2019, 57 ram fattening schemes, mostly owned by women's groups and individuals, were established in 2019, and a total of 1,310 rams were fattened and sold in the Tobaski market.

Few farmers practice supplementary feeding, particularly for lactating ewes and fattening stock. An increase in the population of women-owned sheep and especially goats would mean an increase in women's and youths' access to financial resources; goats are easily converted into cash, which is most likely to be spent on things that improve the quality of life for themselves and their families.

4.12 Conclusions

Closing the gaps between domestic consumption and domestic meat production requires significant improvements in many aspects of small ruminant production: feed, animal health, genetics, marketing and processing, and research and extension. Feed improvement through growing fodder and fodder trees as fences and hedges in the backyard; improving availability of and access to agricultural by-products; conducting routine mass vaccinations and deworming against major diseases and pests in relation to animal health improvement; and a host of other interventions will improve animal productivity and population, which will, in turn, increase the production of meat

from sheep and goats. The goat and sheep populations are each projected to increase by about 28% between 2022 and 2027. Much of the goat and sheep population will be from the Eastern production zone, whose livestock population is more than twice that of the Western and Central zones. Investments to implement the proposed interventions in the small ruminant subsector are projected to result in a substantial increase in meat production from both sheep and goats. Total meat from both species is projected to increase by 56% by 2027 with the proposed investments, with a somewhat larger proportional increase for sheep (but a smaller absolute increase). For both species, most of the meat is projected to come from the Eastern zone, where the concentration of small ruminants is high. This translates into higher production of manure from goats and sheep in 2027. With these investments, it is projected that the overall contribution of meat from small ruminants to GDP will increase by 18%, from an initial GMD 429 million in 2022 to GMD 507 million in 2027.

The analysis suggests that the government should invest in feed, animal health, extension, research and other important components of the small ruminant value chain. Because the availability of feed is a major problem facing the sector, more effort should be targeted at broadening and updating the inventory of feed and fodder resources to cover all production zones and ensure that farmers are sensitized to focus more on increased fodder production and the adoption of other improved feeding practices. With an enhanced policy environment, many other aspects of the small ruminant value chain can be improved.

5 Chicken value chain roadmap (2023–2027)

5.1 A summary of results and conclusions from the 15-year livestock sector strategy (LSS)

Traditional backyard poultry is widespread in all regions, with most households in rural and peri-urban areas keeping some birds for domestic consumption and sale at village and weekly markets. The production system practised is mainly extensive, and women are heavily involved. Recently, commercial poultry production systems have also evolved and are proliferating in the peri-urban areas and around the growth centres. The major challenges affecting the poultry subsector and marketing system include dependence on imported feeds whose prices are affected by currency fluctuations and that lack quality assurance; non-availability of day-old chicks, as there is only one known breeder, which results in dependence on imports from Senegal; recurrent disease outbreaks, particularly Newcastle disease and the occurrence of emerging diseases such as highly pathogenic avian influenza; poor linkages of producers to markets; flooding of the local markets with cheap imports; and poor marketing infrastructure including lack of storage facilities, which causes significant post-harvest losses through spoilage.

Proposed interventions to address the challenge of feeds include expansion of training of women and youth farmers on the formulation of simple feed rations using locally available feed resources; feed supplementation and simple management practices; building of low-cost housing using locally available materials; and crop residue conservation techniques for feed use. In breeding, researchers' documentation of information on good mothering ability in local chickens would facilitate possible breed improvement; conservation of indigenous local chicken breeds such as Firgi and Tunguneh; and re-introduction of affordable local incubators and the cockerel exchange program at the community level. To address the challenge of diseases, vaccination campaigns against Newcastle disease are recommended together with the promotion of better management practices (housing, health, and feed packages); training women and youth on poultry vaccination and deworming for wider and better coverage; and sensitizing farmers about disease outbreak reporting, emergency preparedness and control measures. To address challenges in marketing, the set of interventions that are recommended include conducting sensitization campaigns and promotion of marketing of poultry and poultry products during livestock shows and fairs; organizing poultry field and market days to coincide with sociocultural events and celebrations; and using other market outlets such as 'loumos' (weekly markets) to emphasize and encourage marketing at the village level.

Results of foresight analysis indicate that:

- Without additional investments (the BAU scenario), chicken meat production is projected to increase only 43% from 2022 to 2037, but with investments (the WI scenario), growth will be considerably higher.
- The current gap between domestic production and consumption of chicken meat is projected to persist and widen under the BAU scenario. With investments, domestic production is projected to equal domestic consumption between 2032 and 2037.

- Without additional investments, egg production is expected to increase only 71% from 2022 to 2037, but with investments, this production increase is projected to be much larger – more than 600%.
- As for chicken meat, the current gap between domestic production and consumption of eggs is projected to persist and widen under the BAU scenario. With investments, domestic production is projected to equal domestic consumption between 2031 and 2036.

5.2 Five-year vision for the chicken value chain

The vision is to increase the income and nutritional security of chicken producers and all other individuals in the country by raising chicken meat and egg production. The backyard indigenous chicken (BIC) and specialized commercial chicken (SCC) populations are projected to increase by 25% and 331%, respectively, which would significantly increase meat production by 135% for BIC and 421% for SCC over the five-year LMP period. Similarly, egg production in the country is projected to increase by 25% and 218% for BIC and SCC, respectively. It is also projected that the combined GDP contribution of the poultry sector will increase by 244% during the LMP period.

5.3 Investment scenarios analysed

As with other livestock species, the BAU and WI investment scenarios are examined for chicken and eggs. These scenarios are assessed for their implications on productivity, farmers' incomes, chicken meat and egg production, and contribution to GDP. The WI scenario increases farmers' incomes, chicken meat and egg production, and contribution to GDP through assumed increases in the number and productivity of chickens. In the case of commercial layers and broilers, the WI scenario primarily targets increasing the number of chickens and complementary input and service improvements. The WI scenario in the case of backyard chickens, on the other hand, focuses mainly on increasing the productivity per bird of egg and meat.

5.4 Description of chicken production systems

Traditional poultry production is the predominant chicken production system in the Gambian farming system. It is extensive, and birds are poorly housed and fed and provided with little or no veterinary healthcare. Small flocks (10–15 birds) that are mostly owned and managed by women and children are kept in the backyards of their owners' households. They are confined during the night in kitchens or locally made shelters to minimize predation, whereas during the daytime birds are left to scavenge in backyards. Supplementary feeds such as millet, coos, brans and household leftovers are provided in the evenings when they return to the households. The poultry flocks are made up of local breeds that are low producers of meat and eggs compared to exotic breeds. However, the birds are hardy and relatively easy to convert to cash or slaughter for home consumption, and for this reason, they serve as a ready source of income and protein for many households in rural communities.

According to the National Livestock Census (2016), there were 937,951 chickens in the Gambia. Out of these, 94.5% were produced using the extensive free-range traditional/backyard system, whereas 5.5% were from intensive/commercial farms. Results of the Census indicate that 67% of chickens were owned by women. Almost every Gambian family in the rural areas owns chickens. Commercial farmers keep improved breeds – both broilers and layers. All commercial farmers use complete feeds, and almost all forms of complete poultry feeds are imported into the country.

5.5 Overall livestock master plan targets under the intervention scenario

The total commercial chicken population is projected to increase under the WI scenario by 331% over five years. In contrast, BIC hens are projected to increase by 25% in the same period (Table 14). The largest commercial chicken population is projected to come from broilers, with an estimated 64% of the commercial chicken population in 2027. The broiler population is projected to increase by 438% compared to 218% for the layer population over the five years.

Table 14: Backyard indigenous chicken (BIC) and specialized commercial chicken (SCC) population targeted for five years under the scenario with additional investment (WI)

Chicken system	Base year 2022	2023	2024	2025	2026	2027	% change
BIC hens number	88,108	92,072	96,216	100,545	105,070	109,798	25%
Layers	112,755	142,071	179,010	225,552	284,196	358,087	218%
Broilers	119,113	166,758	233,461	326,845	457,583	640,616	438%
Total SCC	231,868	308,829	412,470	552,397	741,779	998,703	331%

Source: The Gambia LMP analysis

Over the five years, chicken meat is projected to increase by 315% by 2027 (Table 15). Meat from commercial chickens is projected to make up about 79% of the total projected chicken meat in 2027. Broiler meat is projected to make up most of the projected meat from commercial chickens (95%) in 2027, whereas meat from BIC would make up only 21% of the total meat projected to be produced in 2027. Although commercial meat production is projected to increase by 421%, meat from BIC will also witness an increase of 135% over five years.

Meanwhile, total egg production is projected to increase by 197% over five years (Table 15). Much of this increased egg production is projected to come from commercial layers, with 95.6% of the total egg production in 2027. Eggs from BIC are projected to increase by 25%, from 2.6 million in 2022 to 3.3 million in 2027.

Table 15: Production of eggs and meat from backyard indigenous chickens (BIC) and specialized commercial chickens (SCC) targeted for five years under the scenario with additional investment (WI)

	Chicken systems	Unit	Base year 2022	2023	2024	2025	2026	2027	% change
Meat	BIC	Tonnes	455	540	641	760	902	1,070	135%
	Layers	Tonnes	61	76	96	121	153	193	218%
	Broilers	Tonnes	713	998	1,397	1,956	2,738	3,833	438%
	Total SCC	Tonnes	773	1,074	1,493	2,077	2,891	4,026	421%
	Overall	Tonnes	1,228	1,614	2,134	2,837	3,793	5,096	315%
Eggs	BIC	Thousands	2,643	2,762	2,886	3,016	3,152	3,294	25%
	SCC	Thousands	22,421	28,251	35,596	44,851	56,512	71,205	218%
	Overall	Thousands	25,064	31,013	38,482	47,867	59,664	74,499	197%

Source: The Gambia LMP analysis

5.6 Opportunities, challenges and strategies

There is a very high demand for eggs and poultry, particularly in the urban and peri-urban areas, and this is satisfied mainly through imports. However, most consumers prefer chicken produced through the traditional extensive (backyard) system with the belief that it is organic and tastes better.

The challenge to traditional backyard poultry production is centred around the dependence on indigenous chicken breeds that are not very productive; high mortality rates when outbreaks of Newcastle disease and other poultry diseases occur; poor management practices; and inadequate access to balanced feeds and veterinary services. The biggest challenge for the commercial poultry sector is the dependence on imported feed and other production inputs and inadequate access to credit.

Strategies for strengthening the performance of the poultry subsector should include the following:

- Upscale the Newcastle disease vaccination campaigns to include backyard poultry farmers to reduce mortality and morbidity during outbreaks.
- Train women farmers on the provision of better management practices (housing, health and feed packages) for poultry.
- Introduce the provision of hygienic shelters made from locally available materials.
- Sensitize backyard poultry farmers on disease outbreak reporting, emergency preparedness and control measures to take when outbreaks occur.
- Promote feed supplementation and improved housing to enhance the capacity of farmers to produce greater numbers of chicks and eggs for sale and domestic consumption.
- Carry out sensitization campaigns and promote marketing of poultry and poultry products during livestock shows and other events.
- Encourage the usage of other marketing outlets such as loumos (weekly markets) to market poultry and poultry products.

5.7 Improving backyard indigenous chickens (BIC) (2023–2027)

5.7.1 Targets for backyard indigenous chickens

As stated in the previous section, the BIC hen population will increase by 25% under the WI scenario, and meat from BIC will increase by 135% during the five years (Table 16). Eggs from BIC will increase by 25% over the period, which suggests investments will benefit the farmers and households who focus on BIC production.

Table 16: Number of hens and chicken eggs and meat production in backyard indigenous chicken projected for 2022 to 2027.

Chicken systems	Base year 2022	2023	2024	2025	2026	2027	% change
Hens	88,108	92,072	96,216	100,545	105,070	109,798	25%
Meat (tonnes)	455	540	641	760	902	1,070	135%
Eggs (thousands)	2,643	2,762	2,886	3,016	3,152	3,294	25%

Source: The Gambia LMP analysis

5.7.2 Backyard indigenous chicken improvement priority interventions

5.7.2.1 Feed and feeding intervention:

- Enact regulations and acts that discourage the export of brans and oil seed cakes outside the country within three years.
- Sensitize and train farmers on utilizing and feeding locally available feed supplements, brans and oil seed cakes to BIC. It is targeted that the number of BIC farmers that supplement their birds with locally available feed supplements, brans and oil seed cakes will increase to 15% in five years (2023–2027).
- Advise farmers on different possible ration formulas, which can constantly evolve with the dynamic locally available feed base. BIC ration formulas can be produced using locally available feeds, and farmers will be sensitized.

5.7.2.2 Health interventions:

Many of the health service improvement interventions listed under the cattle meat and milk improvement intervention sections also apply to other livestock species, including chickens. The following interventions are specific to the chicken sector:

- Increase the number of vaccinated BIC against Newcastle disease and fowl pox to 65% by the end of 2027. By 2022, the total number of BIC vaccinated against these priority diseases was about 86,500, i.e., about 8.6% (DLS 2020).
- Increase the percentage of farmers applying internal and external parasite treatments to 65% by the end of 2027. Currently, the practice of applying internal and external parasite treatments to BIC is rare.
- Facilitate animal medication access by creating additional veterinary outlets (pharmacies) and cold storage facilities for vaccines.
- Train farmers on biosecurity measures.

5.7.2.3 Genetic improvement:

- Develop a BIC breeding policy in the coming two years.
- Establish a BIC breed improvement program and distribute improved indigenous cocks. In five years of the LMP period, it is targeted to start the pilot phase and distribute improved indigenous cocks to farmers for pilot research work.
- This and the below are projected outcomes from investments, not actions.

Table 17: Projected increase in the number of backyard indigenous chickens (BIC) and per cent growth rate under two scenarios

Scenarios	BIC population		Population growth rate
	2022 (base year)	2027	2022 to 2027
Business as usual (BAU)	1,117,173	1,250,222	2.28%
With additional investment (WI)	1,117,173	1,392,202	4.5%

Source: LS IPT results

The extension and research improvement interventions listed under the cattle meat and milk improvement section also cater to different livestock species, including chickens. Additional extension-related interventions that are specific to chickens are:

- Increase the number of farmers receiving intensive and continuous chicken improvement trainings (training, exchange visits, farmer advisory services, practical demonstrations) to 20,000 (about 50% of BIC farmers) by the end of the five years (2027). Currently, very few farmers get BIC improvement training.
- Develop BIC improvement training manuals in the coming two years and encourage farmers to also engage in the commercial production of BIC.

5.7.2.4 Marketing and processing interventions:

- Establish 10 indigenous chicken producers' cooperatives and a federation.

5.7.3 Impacts of backyard indigenous chicken interventions

5.7.3.1 Production impacts

Meat production from BIC is projected to increase by 135% over five years (Table 16). Similarly, the proposed interventions are projected to increase egg production from BIC by 25% in 2027. The increase in meat and eggs from BIC is projected to result from the increase in the population of BIC hens by 25% within the period based on the assumed impact of the interventions described in the previous section.

5.7.3.2 GDP impacts

The adoption of the proposed interventions is projected to increase the contribution of BIC to GDP significantly, from GMD 51 million in 2022 to GMD 157 million in 2027 (Table 18). Much of this contribution will come from increased chicken meat, for which a 253% increase is projected. The contribution of BIC eggs to GDP is projected to increase much less at 32%.

Table 18: Changes in GDP contribution of backyard indigenous chicken (BIC) for 2022 and 2027

Products	2022	2027	Change in %
Meat GDP contribution	GMD 41 million	GMD 144 million	253%
Eggs GDP contribution	GMD 10 million	GMD 14 million	32%
Total BIC GDP contribution	GMD 51 million	GMD 157 million	208%

Source: The Gambia LMP analysis

5.8 Scaling up specialized commercial chicken (SCC) production (2023–2027)

5.8.1 Specialized commercial chicken targets

The total population of both layers and broilers is projected to increase by 331%, from 231,867 in 2022 to 998,703 in 2027. The broiler population, which makes up 64% of the total projected population in 2027, is expected to increase by 438%, and the layer population is projected to increase by 218% over the five years (Table 19). An increase in animal numbers is projected to increase total SCC meat production from 773 tonnes to 4,026 tonnes, a 421% increase. Broiler meat, which is projected to form the majority of the total chicken meat from SCC, is projected to increase by 438% compared to a 218% increase for layers. Eggs are projected to increase by 218%, from 22.4 million to 71.2 million.

Table 19: Increase in numbers of chickens and egg and meat production in specialized commercial chicken (SCC) systems

Chicken farm types	Base year 2022	2023	2024/25	2025/26	2026/27	2027	% change
Layers	112,755	142,071	179,010	225,552	284,196	358,087	218%
Broilers	119,113	166,758	233,461	326,845	457,583	640,616	438%
Total	231,867	308,829	412,470	552,397	741,779	998,703	331%
Layers – meat (tonnes)	61	76	96	121	153	193	218%
Broilers – meat (tonnes)	713	998	1,397	1,956	2,738	3,833	438%
Total – meat (tonnes)	773	1,074	1,493	2,077	2,891	4,026	421%
Layers – eggs (thousands)	22,421	28,251	35,596	44,851	56,512	71,205	218%

Source: The Gambia LMP analysis

5.8.2 Challenges for commercial chicken production in the Gambia

The constraints and challenges facing both layer and broiler producers are very similar. They are associated with difficulties importing day-old chicks and feed, frequent disease outbreaks and inadequate market infrastructure. Commercial farmers depend on imported feeds and day-old chicks, making them vulnerable to currency fluctuations and price hikes. Cheaper imported eggs and broilers are distorting the market and putting heavy pressure on local producers.

Strategies for strengthening the performance of the commercial chicken subsector include the following:

- Discourage export of locally produced chicken feed ingredients.
- Encourage the establishment of parent-stock farms.
- Strengthen the commercial chicken feed, day-old chick and other input quality control/regulation systems.

5.8.3 Priority interventions in the specialized commercial chicken value chain

5.8.3.1 Feed and feeding interventions

- Strengthen the Food Safety and Quality Authority (FSQA) to improve its capacity to regulate the quality of feeds and feed ingredients. The FSQA can also closely work with the locally available feed quality laboratories.
- Prepare commercial chicken feed quality standards within two years
- Encourage and support farmers to grow maize and soybean with or without irrigation for use as a chicken feed ingredient
- Encourage contract farming between feed millers/processors and cereal farmers by holding matchmaking events.
- Encourage the importation of maize for poultry feed to decrease pressure on indigenous maize production used for human consumption. Also, encourage the importation of other poultry feed ingredients such as soybean, minerals, vitamins and pre-mixes.
- Improve the utilization of the installed capacity of the existing five commercial chicken feed processing plants and establish additional chicken feed processing plants as required.

- Establish silos for both imported and locally produced chicken feed ingredients and processed feeds in a public-private partnership (PPP) in five years.
- Conduct additional research on alternative feed ingredients for poultry production.

Table 20: Projected annual feed requirement estimates for commercial chicken in the Gambia in the coming five years^[2]

	Farming systems	Commercial chicken annual feed requirement estimates (tonnes)	
		Base year 2022	2027
Annual feed requirements	Layers	3,270	10,385
	Broilers	1,787	9,609
	Total	5,057	19,994

Source: LS IPT result and own calculation

- Health interventions
- Sensitize indigenous and commercial chicken farmers to vaccinate all their birds against Newcastle disease, gumbo, fowl pox and Marek's disease to mitigate the risk of cross infections.
- Train all commercial farmers and traders on biosecurity measures.

5.8.3.2 Genetic improvement interventions

- Establish one commercial chicken parent stock farm with subsidies from the government within three years.
- Increase the number of hatcheries. Currently, there is demand for about 800,000 day-old chicks per year. The number of hatcheries needs to be increased to meet the expected day-old chick demand of about 4 million per year (about 3.8 million broilers and 0.2 million layers) by 2027.
- Promote contracts between hatcheries and parent stock farmers.

Table 21: Projected increases in the number of commercial farms and average farm size under the scenario with additional investment (WI)

	Farming systems	Base year 2022	2027
Number of commercial chicken farms	Layer	113	179
	Broiler	238	641
Number of birds per commercial farm	Layer	1,000	2,000
	Broiler (per cycle)	500	1,000

Source: LSIPT results

5.8.3.3 Extension and research interventions

The extension and research improvement interventions listed under the cattle meat and milk improvement section also cater to different livestock species, including chickens. An additional extension-related SCC-specific intervention is:

- Support private extension service providers by encouraging veterinary and livestock experts and subsidizing the establishment cost of veterinary pharmacies and input shops. These can serve as veterinary and extension service provision posts.

5.8.3.4 Marketing and processing interventions

- Develop the appropriate acts and regulations in the coming two years to regulate the import of eggs.
- Promote and support the establishment of cold storage rooms (preferably with solar power) and the development of cold chain transportation facilities by subsidizing the private sector.
- Promote and support the formation of commercial chicken producer groups and associations. Strengthen the existing commercial feed producers' association.
- Support contracts between groups of producers and buyers.
- Create platforms for chicken, egg and chicken input producers and buyers to improve the chicken value chain.

5.8.4 Impacts of interventions on commercial chicken production

5.8.4.1 Production

Total meat production from broilers and chickens is projected to increase by 421% by 2027 with the implementation of the interventions proposed in the previous section. Most of the meat is projected to come from broilers, with an increase of 428% between 2022 and 2027, compared to an increase of 218% for meat from layers (Table 19). This projected increase in broiler meat production is due to the projected increases in demand due to population

9. To do the DOC estimates for layers, the total population of layers in the 5th year and the production cycle per year of about 0.7 cycles/year was used

10. To do the DOC estimates for broilers, the total population of broilers in the 5th year and the production cycle per year of about 6 cycles/year was used

increase, urbanization and higher incomes. Similarly, egg production by layers is also projected to increase by 218 within the LMP period. This projected increase in meat and egg production will be due to the 331% increase in the population of broilers and layers during the period (Table 19).

5.8.4.2 Income per bird

Results of the analysis reveal a substantial increase in income per bird that will accrue to women who raise birds under the backyard system when the proposed interventions on the different components of the value chain are adopted. The women in the backyard system will witness an increase in their income per bird from GMD 582 in 2022 to GMD 2,357 in 2037, a 305% increase (Table 24). With mostly women involved in this type of production system, it is important that the needed investments are made to empower women and help transform the sector to improve livelihoods.

Table 24: Annual income per animal from women-owned backyard chickens in 2023 and 2037 under the scenario with additional investment (WI)

	Base year 2023	2037	% change
Women-owned backyard chickens, income per bird	GMD 582	GMD 2,357	305%

Source: LS IPT results

5.8.4.3 GDP contribution

The contribution of meat and eggs from SCC to the country's GDP is projected to increase by 360% and 197% respectively between 2022 and 2027 (Table 25). About three-quarters of the higher GDP contribution in 2027 is projected to come from increased meat production. However, the total GDP contribution from SCC is projected to increase from GMD 31.5 million to GMD 127 million in five years, about a 300% increase. This will further contribute substantially to the overall contribution of livestock to agricultural GDP and national GDP estimates.

Table 25: GDP contribution from the specialized commercial chicken (SCC) system, 2022 and 2027

Products	Base year 2022	2027	% change
SCC meat GDP contribution	GMD 20.5 million	GMD 94.2 million	360%
SCC eggs GDP contribution	GMD 11 million	GMD 32.8 million	197%
Total GDP contribution	GMD 31.5 million	GMD 127 million	303%

Source: The Gambia LMP analysis

5.9 Investment budget

Total investments in chicken meat and eggs are about USD 5.7 million during the five years of the LMP. Animal health accounts for the largest share of the investment (54%) (Table 26). Most investments are expected from the private sector (Figure 11). The annual level of investments is planned to rise steadily from about USD 840,000 in the first year to USD 1,450,000 in year five (Annex Table 8). Specific interventions accounting for the largest share of the total investments include supporting the adoption of the practice of applying internal and external parasite treatments to 65%; increasing the number of hatcheries and hatchery capacity to meet the expected day-old chick demand of about 4 million; increasing the proportion of vaccinated backyard chickens against Newcastle disease and fowl pox to 65%; and promoting the establishment of cold storage and purchase of cold transportation facilities by subsidizing the private sector (Table 26).

Table 26: Chicken roadmap investment cost by intervention areas

	Total (USD)	Private (USD)	Public (USD)	Share of investments by category
Feed and feeding	1,045,000	639,500	405,500	18%
Animal Health	3,076,830	3,001,830	75,000	54%
Genetic improvement	860,000	768,000	92,000	15%
Education, research and extension services	50,000	0	50,000	1%
Marketing investments	690,000	402,000	288,000	12%
Total	5,721,830	4,811,330	860,500	100%

Figure 11: Chicken investments by intervention areas and source of funding.

5.10 Impact of chicken improvement interventions on total chicken meat and egg production and GDP contribution

5.10.1 Total chicken eggs and meat production

Additional investments in the proposed chicken improvement interventions in both the BIC and SCC systems improve meat and egg production from the base year. Total meat production is projected to increase by 315% within five years, from an initial 1,228 tonnes to 5,096 tonnes (Table 27). The majority of this is projected to come from SCC, whose contribution will be 3.8 times more than the contribution from BIC. While meat from the SCC system is projected to increase by 421%, that of BIC will increase by 135% within five years. On the other hand, total egg production resulting from investments in chicken improvement interventions is projected to increase by 197%. Like meat production, the majority of this is projected to come from the SCC system, with a contribution that is about 22 times more than that of the BIC system. This is due to the increased animal population that will result from the additional investments in the interventions.

Table 27: Backyard indigenous chicken (BIC) and specialized commercial chicken (SCC) meat and egg production in the scenario with additional investment (WI)

Products	Unit	Base year 2022	2027	% change
Total chicken meat from BIC system	Tonnes	455	1,070	135%
Total chicken meat from SCC system	Tonnes	773	4,026	421%
Total chicken meat production	Tonnes	1,228	5,096	315%
Total eggs from the BIC system	Thousands	2,643	3,294	25%
Total eggs from SCC layers	Thousands	22,421	71,205	218%
Total egg production	Thousands	25,064	74,499	197%

Source: The Gambia LMP analysis

5.10.2 Total chicken GDP contribution

It is projected that an increase in meat and egg production from both BIC and SCC systems resulting from additional investments in chicken improvement interventions will increase the contribution of the chicken subsector to GDP. The total GDP contribution of chicken meat and eggs from both systems is projected to increase by 244%, from GMD 82.70 million in 2022 to GMD 284.47 million in 2027 (Table 28). The contribution from BIC to GDP will increase by 208% over the period compared to 303% for SCC, although in terms of magnitude, the contribution of BIC will be more than that of SCC in 2027.

Table 28: Estimate of total chicken meat and eggs GDP contribution in the with additional investment scenario (in Million GMD)

Products	Base year 2022	2027	% change
Backyard indigenous chicken meat and eggs GDP contribution	51.21	157.49	208%
Specialized commercial chicken meat and eggs GDP contribution	31.5	127.0	303%
Total GDP contribution of chicken meat and eggs	82.70	284.47	244%

Source: The Gambia LMP analysis

5.10.3 Return on investment (ROI)

Similar to the backyard system, the ROI under the SCC system indicates that investing in either layer or broiler production is expected to be financially viable. The 20-year net present value analysis for layer production (GMD 4.8 million) and broiler production (GMD 776,000) are both positive, suggesting that the discounted present value of future cash flows related to investment in both production systems will be positive and hence attractive.

5.11 Complementary conditions required for the success of investments

- Land and finance are available for investors in the SCC system.
- There is strong quality control of processed chicken feed, feed ingredients and other chicken inputs.
- More research is conducted on BIC to improve their productivity while keeping their merits.

5.12 Gender and social inclusion implications for chicken value chain development

In the Gambia, traditional backyard poultry production predominates in all production zones. Most households in rural and peri-urban areas keep some birds for domestic consumption and sale at the village level and weekly markets. Often the small flocks of backyard poultry are owned and managed by women and children. Poultry production in the Gambia for both exotic and local breeds is constrained by the lack of balanced poultry feed and its high cost, poor housing, and diseases, especially Newcastle disease, which has extremely high mortality and morbidity rates (almost 100%).

Enhancing productivity in backyard poultry activities through improved animal health, particularly vaccination against Newcastle disease, and improvement in poultry housing and feeding will play an important role in the economic empowerment of women and youth due to increased earnings from sales of birds and eggs. The enhanced availability of chicken meat and eggs will contribute to better nutrition for all, especially women and children. Due to the prominent role of women and youth in poultry activities, the delivery of extension messages and other interventions should actively target them to have a higher chance of success.

The scope for leveraging the poultry value chain to address the challenges of widespread poverty and poor nutrition among vulnerable groups such as women in the Gambia is large, owing to a huge market for poultry and poultry products, especially considering the tourist industry including both the formal and informal sectors, hotels and the fast-growing bed and breakfast providers in private properties.

5.13 Conclusions

As significant as poultry is to the majority of households in the Gambia, and the growing interest in commercial poultry production, the number of constraints identified in the areas of feed, animal health, provision of services and marketing, among others, are limiting the benefits that poultry provides to individuals, households and the economy. Poultry, particularly traditional backyard chicken, forms a major part of the diet of most Gambian homes and is significant in serving as a source of investment for meeting other household demands. It is one of the main agricultural activities for women and other vulnerable groups in the Gambia. Still, little attention has been given to its improvement compared to the other species, though some strides have been made. With the demand for both chicken meat and eggs projected to increase due to factors such as urbanization, population growth and increase in incomes, there is the need to focus on interventions that will improve the industry in the areas of feed quality and quantity, animal health, and provision of support services such as extension and veterinary, marketing, processing, research, genetic improvement and access to credit by farmers.

The proposed improvement intervention requires private and public investment to ensure that the sector is given appropriate attention and support. Promotion of biosecurity measures at the individual, household, community, regional and national levels is needed in animal health improvement. Raising the availability and quality of feeds, strengthening poultry producers' associations, and improving processing facilities are some of the interventions needed to support the growth of the layer and broiler chicken population. With the much-needed investments in the areas mentioned, it is projected that BIC and SCC populations will increase by 25% and 331%, respectively, which will significantly increase meat production by 135% for BIC and 421% for SCC over the five years. Egg production from BIC is also projected to increase by 25%, while that of SCC will increase by 218%, with a combined GDP contribution of 244% over the period. These increases will positively impact the livelihoods of women poultry farmers.

6 Complementary and added value of the livestock master plan to the livestock budget planning of the Government of the Gambia

The Gambia LMP was prepared to complement the budget and livestock planning process. The following section discusses the complementarities of the Gambia LMP with the National Development Plan (NDP), Agriculture and Natural Resource Policy (ANRP) and the Gambia National Agricultural Investment Plan II (GNAIP II). The Gambia livestock budget is analysed to highlight the added value of the LMP, followed by a discussion of any overlaps in the livestock budget and LMP strategies and activities so that the Ministry of Agriculture or Animal Production Department can rationalize the budget allocated towards the livestock sector and, where necessary, to improve the implementation potential of investment.

6.1 The Gambia Livestock Master Plan (LMP)

The Gambia LMP, which includes a livestock sector analysis, livestock sector survey (LSS) and the investment roadmaps, has been produced through a quantitative analysis using a herd and economic sector model (HESM) developed by experts from the Ministry of Agriculture and the ILRI team. The HESM developed in the livestock sector analysis and LSS made possible the elaboration of the detailed five-year investment plans, which make up the livestock value chain roadmaps, with each roadmap having focused interventions, investment budget activity and time plans. As explained in the introduction to the livestock sector analysis, the objective of the Gambia LMP is to provide quantitative and evidence-based justification for greater public and private funding of sector investments. The LSS resulted in recommended and prioritized livestock value chains and investment interventions with the most potential to further modernize the sector. The recommended investments have been chosen based on an analysis of the ROIs in additional combined technology and policy options. The LSS foresight or future impact analysis resulted in investment roadmaps for dairy, red meat and chicken.

6.1.1 Summary of total LMP budget

Table 29 presents the consolidated budget for the dairy and beef, small ruminants and poultry value chains. Implementation of the proposed interventions in the Gambia LMP in the first five years will cost about USD 44.2 million, with the public and private sectors contributing USD 33.2 million and 11.0 million, respectively. Investments in animal health will account for 35% of the investments, closely followed by education, research and extension services (33%).

Table 29: Consolidated budget for the LMP priority livestock value chains

Overall	Total	Private	Public	Share of investments by category
Feed and feeding	5,991,880	3,239,190	2,752,690	14%
Animal Health	15,579,265	3,538,649	12,040,616	35%
Genetic improvement	4,475,316	1,204,486	3,270,831	10%
Education, research and extension services	14,559,051	2,000,000	12,559,051	33%
Marketing investments	3,587,473	976,385	2,611,088	8%
Total	44,192,985	10,958,709	33,234,276	100%

6.2 Value addition of the LMP process

The priority livestock value chains of the Gambia LMP are cattle, sheep and goats, and poultry. In preparing the LMP, the animal husbandry department and ILRI team of experts tried not to duplicate the strategies covered in the NDP and ANRP.

In the LMP, the prioritized set of livestock roadmaps recommended are three and are somewhat differently focused: cattle (N'Dama, Zebu/Gobra and commercial dairy), small ruminants (Djallonke, Sahelian and women-owned [Djallonke]) and poultry (layer, broiler, backyard indigenous chickens). The choice of the recommended livestock value chains in the LMP is well explained, as well as the contribution of the livestock sector to the country's development objectives.

The LMP adds a more detailed quantitative analysis of the current state of the livestock sector and proposes future investment interventions which could help achieve the country's development objectives and the NDP and ANRP targets.

In the LMP, the HESM was used to do the following additional quantitative analyses:

- Projecting the future demand for the priority livestock products and setting production targets to meet this future demand.
- Identifying the challenges and opportunities faced in achieving the targets.
- Making the links between the interventions chosen and their impacts on LMP and livestock development in the country.
- Calculating the expected returns from proposed investments (ROIs) in alternative interventions to achieve the targets.
- Calculating the intervention impacts on the country's development goals: income growth, employment and farmer investment.
- Specifying the additional investments (public–private partnerships) required to implement the interventions and reach the LMP targets.
- Identifying the complimentary success factors needed to achieve the projected impacts.
- Identifying policy changes needed to achieve the technology results to be combined with the technology interventions.

In the LSS, future demand growth was determined by rates of change in human population and urbanization and per capita income and the income elasticities of demand for the various livestock food products. However, no projection has been made to prepare the government's 2022/23 livestock budget and set the targets in the NDP and ANRP.

In the LSS and investment roadmaps, the following measures were taken to ensure that the targets and results of the projections were reliable:

- Several sessions of virtual meetings and in-country visits for data collection were undertaken, in which the LMP team cross-checked the data and model results.
- Estimates of technical productivity parameters, population numbers and economic and financial data, as well as information on the opportunities, challenges and interventions used to specify the HESM model, were collected from published literature and cross-checked by experts from different organizations working in the livestock sector in the Gambia.
- One-on-one consultations and group-level technical discussions were held to get expert agreement on all data and parameters and to ensure realistic model projections and results.
- Data projections were made using the HESM and sensitivity analysis was carried out to identify critical data and parameters impacting the targets and projections of results.
- The experts further cross-checked and validated model results at several virtual stakeholder workshops, where the NTC and external experts representing government departments, research and the private sector attended. All parameters, projections and results were endorsed.
- Among the more important examples of the added value of the Gambia LMP is the fact that the LMP has analysed details of the livestock sector of the Gambia before proposing any investment. The LMP analysed the impacts of recommended interventions on gender, by focusing on value chains that women are engaged in currently in the Gambia, and provides strategies and activities for institutionalizing gender and social inclusion-sensitive interventions. The LMP, besides presenting the impacts of interventions, projects demand requirements from the base year and projected impacts of interventions on mean household income and GDP. The LMP presents the base year and projected impacts of interventions on household income (or poverty reduction), GDP (or national income), food and nutritional security, surplus production for exports, income for investment generation, etc. Three livestock production zones were identified and considered in the LMP to contextualize the different opportunities, challenges and interventions.
- GDP contributions are also disaggregated by value chains, agroecological zones, species, breeds and herd sizes. This disaggregation helps to prioritize value chains, species and breeds, as well as allocation of funding. In the NDP and ANRP, the projected impacts of interventions are not available. The impacts of interventions on livestock population, household income and GDP can be traced from the animal to the production zone/national level in the LMP.
- The LMP complements the NDP and ANRP because those do not project the impacts of interventions. Furthermore, because the uptake of the proposed investment interventions could be limited by the availability of input resources, especially feed and land, an analysis of feed balance was done to see the potential increase in milk, meat and egg production given the limitation of land and feed resources.

6.3 Summary of existing agriculture and livestock plans

The livestock sector in the Gambia does not have a standalone sectoral strategic plan or policy. However, the policy environment for the livestock sector is anchored on three policies that are closely interlinked in terms of visions and objectives:

- The National Development Plan (NDP) (2018–2021)
- The Agriculture and Natural Resources Policy (ANRP) (2017–2026)
- The Gambia National Agricultural Investment Plan II (GNAIP II) (2019–2026)

The policy objectives of the NDP were the creation of “a modern, sustainable and market-oriented agriculture and livestock sector for increased food and nutrition security, income and nutrition security, employment generation, poverty reduction, and economic transformation”. This policy document set targets for the livestock sector that were to be met within three years: to increase cattle production by 8%, sheep by 5%, goats by 11%, backyard poultry by 8% and commercial poultry by 6%.

The ANRP 2017–2026 was developed with a significant departure from the development emphasis of the last 20 years, and is founded on a vision of creating “a marketed-led commercialized, efficient, competitive and dynamic ANR sector in the context of sustainable development”. It is guided by the over-arching objective of maximization of poverty reduction and enhancement of food, income and nutrition securities through the optimal utilization of the resources of the sector consistent with safeguarding the integrity of the environment.

The ANRP recognizes that the continued growth and expansion of the livestock industry will depend on the availability of a quality, reliable and inexpensive supply of animal feed and feed supplements. Thus, further efforts in diversifying the rudimentary feed industry are being undertaken to sustain the comparative and competitive advantage in producing meat, eggs and milk for domestic consumption and expanded export.

The ANRP (in conformity with the LMP) reiterates that satisfying the increased demand for animal products and easing pressure on natural resources imposed by animals will require the adoption of intensification. Thus, both propose the upscaling of intensification, such as ram fattening schemes and the establishment of compost pens for improved meat, milk and manure production and draught power. Thus, these activities and their needed technical, financial and institutional support for their widespread dissemination constitute the core of the sector policy strand for the ANRP 2017–2026. The mentioned activities, among others, include the following:

- Improvement of the feeding systems for cattle, small ruminants and poultry by increasing the availability of high-quality forage, conserving and feeding cereal crop residues.
- Improvement of the genetic potential of local species (cattle, small ruminants and poultry) through selection (open nucleus breeding systems), crossbreeding and importing exotic genetic material.

Analysis of technical feasibility and financial profitability of intensification of enterprises so that husbandry practices needed to advance the industry can be formulated for dissemination by the extension services. The LMP investment roadmaps contribute relevant information about the feasibility and cost-effectiveness of the intensification approaches being promoted by the ANRP.

Lastly, GNAIP II constitutes the main investment framework for agricultural development in the Gambia in the medium term (2019–2026). The GNAIP II aims to increase food and nutrition security at the household level, including for vulnerable households, through increased agricultural and natural resource productivity based on sustainable use and management of natural resources in support of national goals of poverty reduction and improved livelihood. The GNAIP II constitutes six priority axes:

1. Production and value chain promotion on food crops and vegetable subsector.
2. Production and value chain promotion on livestock husbandry and pastoralist subsector.
3. Production and value chain promotion in the fishery and aquaculture subsector.
4. Production and value chain promotion in the forestry and environment subsector.
5. Food and nutrition security, resilience and social protection.
6. Promote good governance of the whole agriculture and natural resources sector.

Priority axes 1–4 include capacity building, youth employment and women’s empowerment, climate change adaptation and regional trade promotion, while axis 6 includes institutional capacity, steering and coordination, monitoring and evaluation, and communication.

Table 30: Estimated Gambia National Agricultural Investment Plan II (GNAIP II) costs by priority intervention areas

Strategic axis component	Cost (USD million)	%
Program 1: Production and value chain promotion on food crops and vegetable subsector	161.47	44.19
Program 2: Production and value chain promotion on livestock husbandry and pastoralist subsector	59.48	16.28
Program 3: Production and value chain promotion on fisheries and aquaculture subsector	75.55	20.67
Program 4: Production and value chain promotion on forestry and environment subsector	9.13	2.5
Program 5: Food Security, nutrition, resilience and social protection	49.76	13.62
GNAIP II coordination, monitoring, and evaluation	10	2.74
Total base cost	365.42	100
Contingency – 5%	18.271	5
Total cost	374.22	102.41

The total budget of GNAIP II for 2019–2026 is estimated at USD 374.22 million, of which the base cost is USD 365.40 million (Table 30). This budget comprises five main programs as well as GNAIP II coordination, monitoring and evaluation. The budget allocated for the production and value chain promotion of livestock husbandry and pastoralism is USD 59.48 million, which is about 16.69% of the total GNAIP II budget (Table 30) and 135% of the Gambia LMP budget (Table 29). The principal livestock activities budgeted in GNAIP II and their share within the total livestock budget are shown in Figure 12. Capacity building and extension, animal health, and feed are allocated about 81% of the total livestock GNAIP II budget. This corresponds with the Gambia LMP budget allocation, which has allocated about 82% of the budget to education and extension, animal health, and feed improvements (Table 29).

Figure 12: The GNAIP II budget proportion for the main components of the livestock sector.

6.4 Budget of the Ministry of Agriculture and Department of Livestock Services

The total recurrent budget allocated to the Ministry of Agriculture for the fiscal year 2022 was GMD 215 million, out of which GMD 9.5 million (4.4%) was allocated to the DLS under the subheading of Livestock Production and Productivity. However, the nomenclature of the subheading is misleading: almost the entire budget is for administrative purposes, with the major expenditure items being travel expenses, maintenance of vehicles, conferences and seminars, and purchases of fuel and lubricants.

A total of GMD 282,862 (or 1.2% of the entire development budget for the country) was allocated to the Ministry of Agriculture for the fiscal year 2022 (Ministry of Finance and Economic Affairs 2023).

The reason for the low levels of allocation of funds to the Ministry of Agriculture and its departments may be attributable to the fact that most of the development and technical work they conduct is funded by projects, and the funds are managed by the Central Projects Coordinating Unit (CPCU) of the Ministry of Agriculture.

Annexe Table 4: Activity timeline and sequencing of cattle interventions:
Gantt chart

S/No	Investment intervention	Activities timeline				
		2023	2024	2025	2026	2027
	Feed and feeding					
1	Review the existing forest regulations/acts within three years to make them accommodative of the pasturelands, ranglands and forests and their sustainable utilization as a source of livestock feed.					
2	The Ministry of Agriculture should engage other relevant stakeholders (such as the Ministries of Local Government and Lands, Justice, Forestry and the Environment and Parks and Wild Life, Civil Society and Community Leaders) to update the Land Use Plan, taking into consideration the urgent needs of the agriculture and livestock sector in the country.					
3	Demarcate, map and gazette grazing areas and stock routes within the first 4 years of the livestock sector strategy.					
4	Sensitize and train farmers on the prevention and control of bushfires.					
5	Promote regeneration of degraded ranglands.					
6	Over-sow palatable feed species, including Adropogon gayanus, Panicum and Brachiaria species.					
7	Construct access/slipways to rivers in 20 of the areas that currently have low access to animals.					
8	Construct 70 boreholes with the contribution of herd owners.					
9	Develop 40 low-lying areas and improve the harvesting of water.					
10	Plant fodder tree species such as Pterocarpus erinaceus, Leucocéfala, Acacia albida and Leucaena in community forest parks and ranglands and around boreholes and slipways.					
11	Sensitize farmers to grow fodder and fodder trees as fences and hedges in the backyard and other areas to supplement cattle and enhance feed availability during the dry season.					
12	Sensitize farmers to supplement lactating cows with additional locally available concentrate feeds, salt and mineral licks. It is targeted to raise the proportion of cattle farmers that supplement their lactating cows with some form of concentrate feed to 50% by the end of 5 years.					
13	Sensitize the use of leguminous plants, e.g. Pterocarpus erinaceus, Acacia albida (Faidherbia albida) and Cajanus cajan.					
14	Liaise with the National Seed Secretariat (NSS) to have a strong fodder seed quality regulatory department within the NSS.					
15	Sensitize farmers to harvest green feeds during the wet season and conserve them for use in the dry season.					
16	Sensitize farmers in collecting, preserving and utilizing locally produced crop residues.					
17	Improve the availability of dairy farming and milk processing professionals by increasing the accessibility of long-term training on dairying and milk processing.					

S/No	Investment intervention	Activities timeline				
		2023	2024	2025	2026	2027
18	Limit the export of processed feed ingredients and have a concessional supply for local livestock producers.					
19	Facilitate financial provision and long-term loan payment schemes to commercial operators who want to establish and operate dairy farms.					
20	Support the establishment of a fodder and fodder seed producers' association by covering some of their operational costs for the first 2 years and providing training.					
21	Improve the linkages between associations in the Gambia and other countries like Mali and Senegal.					
	Animal Health					
1	Vaccinate cattle for priority diseases like CBPP, HS, BQ and LSD. The vaccine coverage of CBPP is targeted to increase from the current coverage of about 75% to about 80% in the coming 5 years. The percentage of cattle vaccinated against HS, BQ and LSD is targeted to increase from the current coverage of about null to 30% in 5 years.					
2	In commercial dairy farms, continue vaccination of cattle against CBPP, HS, BQ, LSD and Anthrax and chemoprophylaxis against tick-borne and blood parasitic infectious diseases at the current rate of about full coverage.					
3	Raise the level of external and internal parasite treatment practices among N'Dama cattle owners from the current rates of 15% and 25%, respectively, using anti-parasite chemicals and anthelmintics. It is targeted to increase the rate of anti-parasite treatment to 30% and anthelmintic use to 40% by the end of 5 years.					
4	Strengthen the Veterinary Council within 4 years to make it able to effectively monitor and regulate the importation, distribution and use of veterinary drugs.					
5	Ensure the availability of sufficient vaccines and medicines in the country.					
6	Strengthen the Livestock Training School of the Gambia College of Agriculture through capacity building of trainers and provision of teaching materials, equipment, and protective clothing for trainees, and provide laboratories and practical facilities and equipment throughout the livestock master plan duration.					
7	Revise the current curriculum used to train livestock technicians within 2 years.					
8	Train veterinarians and livestock technicians to scale up their capacity and increase their contribution to the improvement of extension and veterinary service delivery.					
9	Establish an additional 5 veterinary pharmacies and drug outlets in the regions during the 5 years.					
10	Strengthen the 6 existing regional veterinary stations by improving the infrastructures and providing equipment within 5 years.					
11	Improve infrastructure, provide equipment and hire experts to open positions for the 53 existing veterinary sub-stations.					
12	Establish 53 new veterinary sub-stations (one more for every district) within 5 years.					
13	Strengthen the disease surveillance system by improving staff capacity with training and the monitoring system.					

S/No	Investment intervention	Activities timeline				
		2023	2024	2025	2026	2027
14	Build the capacity of the current 82 farmers' sanitary defence committees and raise their number to 120 by the end of the 5 years.					
15	Improve the capacity of the existing 6 Regional Veterinary Laboratories in the coming 5 years by improving infrastructure, equipment, staffing and staff capacity.					
16	Improve the facilities and train laboratory technologists and technicians of the Central Veterinary Laboratory at Abuko.					
	Genetic improvement					
1	Produce cattle breeding policy within 2 years.					
2	Sensitize herd owners on the selection and retention of good breeding bulls and heifers in the local herd. It is targeted to sensitize 60% of livestock farmers by the end of 5 years.					
3	Expand the N'Dama breeding program being conducted by the West Africa Livestock Innovation Centre (WALIC) to produce and distribute elite bulls to farmers through the Gambia Indigenous Livestock Multipliers Association (GILMA). It is targeted that 5% of cattle farmers in the country will have access to elite N'Dama breeding bulls/semen by the end of 5 years.					
4	Strengthen the capacity of WALIC by coordinating and facilitating funds for the construction of more barns, the purchase of more animals, and improved research and training facilities. Also, it is equally essential to provide enhanced laboratory and storage facilities and equipment to expand the laboratories' capacity to include handling breeding materials and activities.					
5	Construct an artificial insemination (AI) centre within 5 years. AI centres will produce semen straws from elite N'Dama bulls and exotic/exotic-cross breed bulls.					
6	Construct a liquid nitrogen storage facility within 5 years.					
7	Train AI technicians. It is targeted to train 100 AI technicians within 5 years.					
8	Subsidize private AI service providers to help them expand their AI service to more livestock producers.					
	Education, research and extension services					
1	Develop livestock extension policy, guidelines and legal framework for extension services within 3 years.					
2	Strengthen the capacities of the livestock research section of the National Agricultural Research Institute (NARI) by improving the research facilities and staffing with livestock researchers and scientists to make it able to conduct livestock research. The research institute must also collaborate with other research institutions like WALIC and others in the subregion.					
3	Coordinate and facilitate the provision of financial support, the necessary equipment, and training opportunities to the staff of WALIC to expand its local cattle improvement program and other research.					
4	Ameliorate mobility of the public extension service providers.					

S/No	Investment intervention	Activities timeline				
		2023	2024	2025	2026	2027
5	Strengthen the Department of Livestock Services (DLS) and other stakeholders' livestock data collection tasks by providing appliances and gadgets, in addition to capacity building and training on data collection (methods and tools) and analysis.					
6	Improve the staff retention of NARI, WALIC and DLS through incentives, career progression opportunities and scholarships.					
7	Upgrade the existing training centres and demonstration units and utilize them to full capacity.					
8	Improve the 53 existing veterinary sub-stations by improving their infrastructure, equipment and staffing, and construct an additional 53 veterinary sub-stations (one for every district) within 5 years.					
9	Promote private veterinary and extension service providers by subsidizing veterinary and livestock experts to establish veterinary pharmacies and input shops that can provide farmers with veterinary and extension services.					
10	Support and subsidize private extension service provider startups.					
11	Ensure the public sector will regulate the private veterinarians and extension service providers and continue researching and providing public veterinary and extension services.					
12	Pursue collaboration between NARI, the University of the Gambia and other stakeholders in the livestock sector to ensure that training at the Faculty of Science produces graduates with skills that NARI and the country need.					
13	Promote adaptive research on the exotic breed and milk improvement along the value chain.					
14	Increase the number of farmers that receive intensive and continuous cattle improvement training (training, exchange visits, farmer advisory services, practical demonstrations) to 50% by the end of 5 years.					
	Marketing investments					
1	Upgrade 2 terminals and 10 primary markets by fencing holding grounds and providing watering facilities, sheds, offices, toilets, loading ramps, slaughter slabs, meat stalls and cold storage facilities within 5 years.					
2	Strengthen the livestock market information system newly established by GILMA and sensitize users about it.					
3	Subsidize cooperatives to introduce specialized vehicles for the transportation of live animals and animal products.					
4	Perform capacity building for market management committees.					
5	Support the establishment of marketing cooperatives for each of the different commodities (dairy, live animals and meat, layers, broilers, and free-range chickens) within 5 years.					
6	Support cooperatives to improve the system of collection, transportation and processing of livestock products.					
7	Encourage and subsidize private actors to enable them to establish small-scale milk processing plants. It targeted that 5 small-scale milk processing plants will be established in 5 years.					
8	Promote private actors to establish 2 modern abattoirs within 5 years.					

S/No	Investment intervention	Activities timeline				
		2023	2024	2025	2026	2027
9	Support commercial dairy farms to enable an increase in their number in the Gambia. It is targeted that about 40 additional commercial dairy farms (with a current farm size of about 65 animals) will be established in 5 years.					
10	Modernize the 10 existing slaughterhouses in 5 years.					
11	Establish a tannery.					

Annexe Table 5: Five-year investment budget of small ruminant improvement interventions

Investment intervention	Unit and/or capacity	Quantity or number	Unit cost in USD	Investment cost in USD					Budget source and amount in %		
				2023	2024	2025	2026	2027	Total	Public	Private
Feed											
Plant fodder trees (Pterocarpus erinaceus, Leucocephala, Acacia albida and Leucaena) in community forest parks and rangelands, around boreholes and slipways and in the backyards of farmers	N/A			10,000	10,000	10,000	10,000	10,000	50,000	50%	50%
Promote the construction of small houses for small ruminants	% of farmers with small houses for sheep and goats	Increase in percentage from 30% to 40%		15,000	15,000	15,000	15,000	15,000	75,000	100%	0
Sensitize farmers to grow fodders and fodder trees as fences and hedges in backyards and other areas to supplement sheep and goats and enhance feed availability during the dry season	Sheep and goats producers	100%		15,000	15,000	15,000	15,000	15,000	75,000	100%	0
Train farmers (50% of beneficiaries being women and youth) in the collection, preservation and enhancement of crop residues such as groundnut hay, maize stover, rice, millet bran, groundnut, sesame cake and cotton seeds	Sheep and goats producers	100%		15,000	15,000	15,000	15,000	15,000	75,000	100%	0

Investment intervention	Unit and/or capacity	Quantity or number	Unit cost in USD	Investment cost in USD						Budget source and amount in %	
				2023	2024	2025	2026	2027	Total	Public	Private
Train commercial sheep and goat farmers to establish intensive feed gardens (starting from 625 m2) using fodder legumes such as Cajanus cajan, Leucaena, Moringa and other palatable species in the forested areas	Sheep and goats producers	100%		10,000	10,000	10,000	10,000	10,000	50,000	100%	0%
Provide a 40% subsidy of the cost of the establishment of commercial sheep and goat farms that practice zero-grazing schemes	New commercial sheep and goat farms that practice zero-grazing schemes	100%		60,000	60,000	60,000	60,000	60,000	300,000	40%	60%
Animal Health (Note: The health service improvement interventions listed under the cattle intervention section also cater to sheep and goats. To avoid repetition, the list of health interventions in the cattle section is not listed again here.)											
Conduct routine mass vaccinations against PPR and pasteurellosis	% of animals vaccinated	80%		22,123	22,123	22,123	22,123	22,123	110,616	100%	0%
Conduct routine deworming campaigns	% of animals dewormed	60%		5,000	5,000	5,000	5,000	5,000	25,000	100%	0%
Genetic improvement											
Develop a breeding policy for sheep and goats in the coming 3 years				20,000	0	0	0	0	20,000	100%	0%
Provide matching grants of USD 2,000 to the seed capital in the establishment of private breeding farms which will undertake developing new and improving existing breeds, multiplication and distribution	New private breeding farms	100%		20,000	20,000	20,000	20,000	20,000	100,000	100%	0%

Investment intervention	Unit and/or capacity	Quantity or number	Unit cost in USD	Investment cost in USD						Budget source and amount in %	
				2023	2024	2025	2026	2027	Total	Public	Private
Support the formation of a community-based local sheep and goat breed improvement scheme	N/A			0	0	20,345	0	0	20,345	100%	0%
Sensitize small ruminant owners on the culling of unproductive animals and the selection and retaining of good breeding rams and bucks in the flock	Small ruminant owners	100%		15,000	15,000	15,000	15,000	15,000	75,000	100%	0%
Strengthen the existing local breed improvement research being carried out by the West African Livestock Innovation Centre (WALIC) by providing adequate resources for purchasing additional rams/ewes, livestock technician training, Geneticists and equipment	N/A			30,000	10,000	10,000	10,000	10,000	70,000	100%	0%
Strengthen livestock farmers' associations such as the Gambia Indigenous Livestock Multipliers Association (GILMA)	Livestock farmers' associations			10,000	10,000	10,000	10,000	10,000	50,000	100%	0%
Marketing											
Form and build the capacity of small ruminant owners' cooperatives and introduce weighing scales to facilitate the marketing of sheep and goats	Small ruminant owners' cooperatives			10,000	10,000	10,000	10,000	10,000	50,000	100%	0%
Improve the infrastructure at the veterinary stations in Yorro Beri Kunda, Sololo and Basse	N/A			40,000	10,000	10,000	10,000	10,000	80,000	100%	0%

Annexe Table 7: Activities timeline and sequencing: Gantt chart

S/No	Investment Intervention	Activities timeline				
		2023	2024	2025	2026	2027
	Feed and feeding					
1	Sensitize farmers to grow fodders and fodder trees as fences and hedges in the backyard and other areas to supplement sheep and goats and enhance feed availability during the dry season					
2	Promote and train farmers in the collection, preservation, and enhancement of crop residues such as groundnut hay, maize stovers, rice, millet bran, groundnut, sesame cake, and cotton seeds					
3	Encourage intensive sheep and goat farms to establish intensive feed gardens (starting from 625m2) through the use of fodder legumes such as Cajanus Cajan, Leucaena, Moringa, and other palatable species on the forested areas					
4	Encourage commercial sheep and goat farms that practice zero-grazing schemes by providing a 40% subsidy					
5	Improve availability and access to agricultural byproducts (cakes, bran, etc.) and raise awareness of the importance of the byproducts of cottage edible oil industries for the livestock sector					
6	Train farmers on the construction of small houses for small ruminants. Farmers can construct these houses using locally available materials. Providing farmers with manuals on how to construct these small sheep and goat houses can speed up adoption.					
	Animal Health					
1	Conduct routine mass vaccinations against PPR and Pasteurellosis. It is targeted to raise the percentage of sheep and goats vaccinated to 80% by the end of five years of the LMP period (2027).					
2	Conduct routine Deworming campaigns. It is targeted to raise the percentage of sheep and goats covered under the routine deworming campaign to 60% by the end of the five years (2027).					
	Genetic improvement					
1	Develop a breeding policy for sheep and goats in the coming three years.					
2	Provide matching grants of US\$2000 to the seed capital in the establishment of private breeding farms which will undertake developing new and improving existing sheep and goat breeds, and perform multiplication and distribution of the breeds.					
3	Encourage commercial sheep and goat farms that practice zero-grazing schemes by providing a 40% subsidy.					
4	Start one community-based local sheep and goat breed improvement scheme					
5	Sensitize small ruminant owners on the culling of unproductive animals, selection and retaining good breeding rams and bucks in the flock.					

S/No	Investment Intervention	Activities timeline				
		2023	2024	2025	2026	2027
6	Strengthen the existing local breed improvement research being carried out by WALIC by providing adequate resources for purchasing additional rams/ewes, and training livestock technicians, geneticists, and equipment.					
7	Strengthen livestock farmers' associations such as GILMA.					
	Education, Research and Extension services					
1	Coordinate and facilitate the provision of financial support, training opportunities, and the necessary equipment for WALIC to expand its local sheep and goat improvement program.					
2	Provide farmers with intensive and consistent training on improved sheep and goat management practices. The proportion of farmers getting intensive and consistent training will reach 50% by the end of the LMP period (2027).					
	Marketing Investments					
1	Construct adequate marketing facilities at the level of the weekly markets at Sare Ngai, Sare Bojo, Brikamaba, Wasu, Jareng, Samitenda, Farafeni, Bureng, Kerr pateh, Ndugukebbbeh, Fass Njaga Choi, Panchang with fencing livestock holding ground, watering facilities, sheds, toilets and loading rams.					
2	Form small ruminant owner's cooperatives and introduction of weighing scales to facilitate the marketing of sheep and goats.					
3	Improve the infrastructure at the veterinary stations in Yorro Beri Kunda (YBK), Sololo, and Basse.					
4	Construct two more terminal markets in the coming five years.					
5	Promote the use of appropriate transportation facilities for animals from primary to terminal markets and enforce the use of refrigerated transport facilities for meat transportation.					
6	Perform a feasibility study for the construction of a tannery and assess the potential market for processed hides and skins.					

Annexe Table 8: Production and reproduction parameters of backyard indigenous chickens

Parameters	Values
Average number of hens	2.2
Average number of cocks	0.6
Age of hens at the start of the laying period (months)	6.0
Duration of the laying period (months)	30
Age of layers at culling (months)	36.0
Age of cocks at culling (months)	48
Adult mortality (% per year)	42%
Number of eggs laid hen/year	60
Eggs sold or consumed on-farm (% eggs laid)	0.5
Eggs available for incubation	66
Egg fertility (%)	67%
Males hatched/year	22.1
Females hatched/year	22.1
Mortality in livestock production (% of birds that die before marketing)	60%
Age of males when sold (months)	4.0
Males raised/year	8.8
Females raised/year	8.8

Parameters	Values
Hens culled/year	0.8
Cocks culled/year	0.2
Number of females to keep for replacement/year	1.4
Number of males to keep for replacement/year	0.0
Males sold or consumed on-farm/year	8.8
Females sold or consumed on-farm/year	7.5
Average live weight of chickens (growers) sold (kg)	1.0
Average live weight of culled hens (kg)	1.2
Average live weight of culled cocks (kg)	1.5
Average dressing percentage	65%
Total number of birds present per hen	7.1
Total number of birds sold or consumed on-farm/year	17.2
Average live weight of birds sold or consumed on-farm	1.0
Animals sold or consumed on-farm/year/hens	7.84

S/No	Investment Intervention	Activities timeline				
		2023	2024/25	2025/26	2026/27	2027
	Feed and feeding					
1	Enact regulations and acts that discourage the export of brans and oil seed cakes outside the country within 2 years.					
2	Sensitize and train farmers on the utilization of bran and oil seed cakes for backyard chickens.					
3	Establish production of backyard chicken ration formulas using locally available feed bases, and sensitize farmers.					
4	Strengthen the Food Safety and Quality Authority (FSQA) to improve its capacity to regulate the quality of imported feeds and feed ingredients.					
5	Prepare commercial chicken feed quality standards within 2 years.					
6	Establish a new certified feed quality testing laboratory with a public-private partnership (PPP) approach in 5 years.					
7	Encourage and support farmers to grow maize and soybean with or without irrigation for use as chicken feed ingredients.					
8	Encourage contract farming between feed millers/processors and cereal farmers.					
9	Encourage the importation of maize, soybean, minerals, vitamins and pre-mixes.					
10	Establish silos for both imported and locally produced chicken feed ingredients and processed chicken feeds in PPP mode in 5 years.					
11	Improve the capacity of the existing 5 commercial chicken feed processing plants and establish 5–10 new chicken feed processing plants with ranging capacities in 5 years.					
12	Conduct additional research on alternative chicken feed ingredients.					
	Animal Health					
1	Vaccinate backyard chickens against Newcastle disease and fowl pox. The percentage of backyard chickens vaccinated against these diseases will reach 65% by the end of 2027.					

S/No	Investment Intervention	Activities timeline				
		2023	2024/25	2025/26	2026/27	2027
2	Treat backyard chickens for internal and external parasites. It is targeted that the percentage of farmers applying internal and external parasite treatments will increase to 65% by the end of 2027.					
3	Facilitate easy access to medication for animals through the creation of veterinary outlets (pharmacies) and cold storage facilities for vaccines.					
4	Train backyard chicken farmers on biosecurity measures.					
5	Sensitize indigenous and commercial chicken farmers to vaccinate all their birds against Newcastle disease, gumbo, fowl pox and Marek's disease to mitigate the risk of cross infections.					
6	Train all commercial farmers and traders on biosecurity measures.					
	Genetic improvement					
1	Develop a backyard indigenous chicken breeding policy in the coming 2 years.					
2	Start a backyard indigenous chicken breed improvement program in the coming 3 years and start the distribution of improved indigenous cocks. Within 5 years, it is targeted to start the pilot phase and distribute improved indigenous cocks to farmers for pilot research work.					
3	Establish a commercial chicken parent stock farm with subsidies from the government within 3 years.					
4	Increase the number of hatcheries to meet the expected annual day-old chick demand of about 4 million (about 3.8 million broilers and 200,000 layers) by the end of 5 years. Currently, there is demand for about 800,000 day-old chicks annually.					
5	Promote contracts between hatcheries and parent stock farmers.					
	Education, research and extension services					
1	Increase the number of farmers receiving intensive and continuous chicken improvement trainings (trainings, exchange visits, farmer advisory services, practical demonstrations) to 20,000 by the end of 5 years. Currently, very few farmers receive backyard indigenous chicken improvement trainings.					
2	Develop backyard indigenous chicken improvement training manuals in the coming 2 years.					
3	Support private extension service providers by encouraging veterinary and livestock experts and subsidizing the establishment costs of veterinary pharmacies and input shops, which can serve as veterinary and extension service provision posts.					
	Marketing investments					

S/No	Investment Intervention	Activities timeline				
		2023	2024/25	2025/26	2026/27	2027
1	Establish an indigenous chicken producers' cooperative and a federation.					
2	Develop the appropriate acts and regulations in the coming 2 years to regulate the import of eggs.					
3	Promote and support the establishment of cold storage rooms and purchase of cold transportation facilities (preferably solar type) by subsidizing the private sector.					
4	Promote and support the formation of commercial chicken producer groups and associations.					
5	Strengthen the existing commercial feed producers' association.					
6	Support contracts between groups of producers and buyers.					
7	Create platforms for chicken, egg and chicken input producers and buyers to improve the chicken value chain.					

ISBN: 92-9146-767-7

The International Livestock Research Institute (ILRI) is a non-profit institution helping people in low- and middle-income countries to improve their lives, livelihoods and lands through the animals that remain the backbone of small-scale agriculture and enterprise across the developing world. ILRI belongs to CGIAR, a global research for development partnership working for a food-secure future. ILRI's funders through the [CGIAR Trust Fund](#), and its many partners, makes ILRI's work possible and its mission a reality. Australian animal scientist and Nobel Laureate Peter Doherty serves as ILRI's patron.
